Thermocouples

A

	Fundamentals.....	A-01
	List of Model.....	A-13
T-101	Thermocouples with Head.....	A-19
T-103	Thermocouple with Head and Tip Assembly.....	A-20
T-104	Thermocouple with Head and Weld Pad.....	A-21
T-105	Thermocouple with Nipple.....	A-22
T-106	Thermocouple with Nipple Union Nipple.....	A-23
T-200	Thermocouple with Mineral Insulated Cables.....	A-24
T-201	Thermocouple with Cable and Fitting.....	A-25
T-203	Thermocouple with Bayonet and Cable.....	A-26
T-204	Thermocouple with Cable and Fitting(Spring Loaded).....	A-27
T-206	Thermocouple with Weld Pad & Cable.....	A-28
T-271	Thermocouple with Cable & Connectors.....	A-29
T-272	Thermocouple Probe with Cable Connectors.....	A-30
T-273	Thermocouple Exhaust Gas.....	A-31
T-274	Thermocouple with Junction Box & Adjustable Compensating Fitting with Stub.....	A-32
T-343	Thermocouple with Connectors.....	A-33
T-344	Thermocouple Inset.....	A-34
T-345	Thermocouple with Inset.....	A-35
T-501	Thermocouple with Thermowells.....	A-36
T-502	Thermocouple with Thermowells & Adjustable Flanges.....	A-37
T-503	Thermocouple with Taper Thermowells & Adjustable Flanges.....	A-38
T-504	Thermocouple with Straight Thermowell Adjustable Comp. Fitting & Cable.....	A-39
T-506	Thermocouple with Thermowell & Coating.....	A-40
T-650	Thermocouple with Nipple & Taper Thermowell.....	A-41
T-651	Thermocouple with N/U/N & Taper Thermowell.....	A-42
T-652	Thermocouple with Nipple & Straight Thermowell.....	A-43
T-653	Thermocouple with N/U/N & Straight Thermowell.....	A-44
T-654	Thermocouple with Straight Thermowell & Adjustable Comp. Fitting.....	A-45
T-655	Thermocouple with Nipple & Straight Thermowell.....	A-46
T-656	Thermocouple with Tapered Thermowell & Adjustable Comp. Fitting.....	A-47
T-657	Thermocouple with Solid Sintered Tungsten Carbide Thermowell.....	A-48
T-726	Thermocouple with Nipple & Flange Thermowell Taper.....	A-49
T-727	Thermocouple with N/U/N & Flange Thermowell Taper.....	A-50
T-728	Thermocouple with Flange Thermowell Tapered & Adjustable Comp. Fitting.....	A-51
T-729	Thermocouple with Nipple & Straight Thermowell.....	A-52
T-730	Thermocouple with N/U/N & Straight Thermowell.....	A-53
T-731	Thermocouple with Straight Thermowell & Fitting.....	A-54
T-732	Thermocouple with N/U/N & Stepped Thermowell.....	A-55
T-733	Thermocouple with Built Up Fabricated Thermowell.....	A-56
T-734	Thermocouple with Flange N/U/N Stepped Thermowell.....	A-57
T-800	Standard Thermocouple with Cable & M-F Connector.....	A-58
T-803	Standard Thermocouple.....	A-59
T-804	Thermocouple with Double Protection Tube & Adjustable Fitting.....	A-60
T-805	Thermocouple with Double Protection Tube & Adjustable Flange.....	A-61
T-806	Thermocouple with Single Protection Tube & Adjustable Flange.....	A-62
T-900	Tri-Level Thermocouple with Long PT Thimble.....	A-63
T-901	Tri-Level Thermocouple with Small PT Thimble.....	A-64
T-902	Single Level Thermocouple with Small PT Thimble.....	A-65
T-903	Thermocouple with Outer-Inner Protection Tube & Counter Flange.....	A-66
T-904	Glass Level Probe/Electrode.....	A-67
T-950	Thermocouple for Molten Aluminium ("L" Shape).....	A-68
T-951	Thermocouple for Molten Aluminium (Straight).....	A-69
T-952	Two Point Thermocouple.....	A-70
T-953	Multi Level Thermocouple.....	A-71

Contents

A-954	Pot Room Thermocouple with Connector.....	A-72
A-955	Aluminium Pot Thermocouple.....	A-73
A-988	Ultra High Temperature Thermocouple with Cable.....	A-74
A-989	Ultra High Temperature Thermocouple with Lemo Connector.....	A-75
A-990	Ultra High Temperature Thermocouple with Male Female Connector.....	A-76
A-991	Ultra High Temperature Thermocouple Transition Joint.....	A-77
A-992	Ultra High Temperature Thermocouple Transition Joint with Lemo Connector.....	A-78

RTD

B

	Fundamentals.....	B-01
	List of Model.....	B-14

ABOUT THE COMPANY

Tempsens Instruments U# I

Tempsens Instruments U# II

AST & Marathon Plant

Tempsens Instruments U# II - MI Cable Plant

About Us

TEMPSENS Instruments (I) Pvt. Ltd is a part of Pyrotech group which was established by four technocrats in 1976 at Udaipur, with its first product as Thermocouples and RTDs.

Today Tempsens is one of the largest manufacturer of temperature sensors with world class manufacturing facilities in India, Germany and China.

Tempsens is an ISO 9001:2008 certified company with NABL Accredited Laboratory.

The company is involved into manufacturing of Thermocouples, RTDs, Thermowells, Cables, Non contact Pyrometers, Heaters and Calibration Equipments etc. with Covered Area of 2,70,000 Sq. Ft.

Tempsens is proud of its technical solution, quick delivery, high technical standards and outstanding quality which have been appreciated and highly valued by its customers worldwide.

Tempsens exports to more than 50 countries.

Tempsens success is driven by its people and their unrelenting focus on delivering results the right way - by operating responsibly, executing with excellence, applying innovative technologies and capturing new opportunities for profitable growth.

Milestones

1976	Pyrotech international Established.
1985	Established Tempsens as separate Unit.
1994	Started Export. Awarded ISO 9002.
2003	Manufacturing of Temperature Calibration Equipments.
2004	Setup Calibration laboratory (NABL Accredited).
2005	NABL Accreditation for Calibration Lab upto 1500° C.
2006	Rajeev Gandhi National Quality Award.
2008	Installing Fixed Point Calibration (Primary Standard) Setup for TPW, Ga, Sn, Zn & Al points, first time in the country in Private Lab.
2009	New facilities started - Tempsens Unit #II for manufacturing cables. Joint venture with Marathon heater Inc, USA for Industrial Heaters.
2010	Joint Venture with AST - Accurate Sensors Technologies (Israel) for Pyrometers.
2011	Awarded with prestigious MSME Award 2010.
2012	Multilocal manufacturing facilities - India, Germany and China. Axis Bank "Business Gaurav SME Awards 2012" for 3 categories – "Best Performing SME". "Best Small Enterprise" under Electronic Goods & Components segment. Best Young Entrepreneur - Mr. Vinay Rathi, Director - Tempsens Instruments.
2013	BOI SME 100 Award 2012. AST & Marathon Heater shifted to new building. MI Cable Plant started. ET Now - Leaders of Tomorrow Award, India Mart, North Region.
2014	Joint venture with Linn High Therm, Germany for industrial furnaces. Awarded ISO-14001, OHSAS-18001. Awarded EEPC INDIA star performer in northern region for export excellence.

FACILITIES

WELDING AND BRANZING

- Laser Welding Machines
- Programmable Micro Plasma Welding Machine
- TIG Welding machines with pulse modulation and rotary positioner
- Induction brazing
- Resistance Welding
- Brazing sets (Oxy-Acetative)

MACHINING

- CNC turning centers
- Turn mill center
- VMC Machines
- Deep Hole drilling machines upto 1500mm drilling capacity
- Milling centers
- Manual Lathe machines
- Cutting machines
- Swaging Machines
- Laser Marking Machines
- Engraving Machines
- Coil Making Machine
- High Frequency Annealing Machine
- MgO Filling Machine
- Rolling Machine & Skinning Machine

CABLE PLANT MACHINERY

- FEP/PFA Extrusion Lines
- PVC Extrusion Lines
- Silicon Extrusion Line
- Conductor Stranding Machines
- Braiding Machines - High speed and regular
- Rewinding Machines
- Vertical Lapping Machines & Stranding Machines
- Tape Wrapping Machines
- PTFE Extrusion and Tape roll down plant

MI CABLE PLANT

- Draw Bench 50 meters
- Annealing Furnace
- MI Polishing Machine

TESTING AND CALIBRATION

- NABL Accredited Calibration Lab - 196°C to 2700°C for contact and non contact sensors
- Computerized Calibration System
- Fixed Point Cells-TPW,Ga, Sn, Zn,& Al and AC bridge for primary Standard
- Digital Radiography setup for junction integrity
- PMI setup for chemical analysis of Alloys
- Pressure test setup
- Helium & Nitrogen leak detector
- Profile Projector
- Dye penetration test setup for weld joints
- Microscopic junction check
- Response time test, least count 1 msec.
- Ultrasonic thickness test
- Giga Ohm Insulation resistance testers
- Mechanical checks - lengths, gauges, concentricity checks
- Conductor Resistance Test
- Test for thickness of Insulation and Sheath
- Physical test for Insulation and outer Sheath
- On line High Voltage test
- Flammability test & Tensile tester

THERMOCOUPLES

High Accurate Thermocouples for variety of applications

► THERMOCOUPLES WITH THERMOWELLS/PROTECTION TUBES

Type	:	J, K, T, E, N
Element Size (MI)	:	0.25, 0.5, 1, 1.5, 3, 4.5, 6, 8 (mm), Other Sizes on request
(Non-MI)	:	1.2, 1.6, 2, 2.5, 3.2 (mm), Other Sizes on request
Protection Sheath	:	SS304, SS321, SS316, SS310 HRS 446, INCONEL 600/601/800, Nickel, Hastalloy, Titanium, Tantalum, Ceramic 610 & C -799, Silicon Carbide, Monel, Nimonic etc.
Configuration	:	Simplex/Duplex/Multipoint

► MI THERMOCOUPLES

Type	:	J, K, T, E, N
Element Size (MI)	:	3, 4.5, 6, 8, 10 (mm) Other Sizes on request
Protection Sheath	:	SS321, SS316, SS310, INCONEL 600, 601, Platinum, Pyrosil, Nimonic, HRS 446 etc.
Configuration	:	Simplex/Duplex/Multipoint
Special	:	As per ASTM E235 for nuclear application

► MINIATURE THERMOCOUPLES

Type	:	J, K, T, E, N, R, S, B
Element Size (MI)	:	0.25, 0.5, 1, 1.5, 3 (mm)
Protection Sheath	:	SS316, SS310, INCONEL 600, Platinum, Pyrosil, Nimonic etc.
Configuration	:	Simplex/Duplex/Multipoint, Swaged

THERMOCOUPLES

► NOBLE METAL THERMOCOUPLES

Type	: R, S, B
Element Dia	: 0.30, 0.35, 0.4, 0.45, 0.5 (mm) other sizes on request
Protection Sheath	: Ceramic (C-799), 610, Inconel, Silicon carbide etc.
Configuration	: Simplex/Duplex/Multipoint.
Special	: Hot Blast & Stove dome Thermocouples For Glass Industry- Tri level Thermocouples Fore-hearth Thermocouples Furnace Bottom Thermocouples Distributor Thermocouples Furnace Crown Thermocouples Refiner Thermocouples Annealing Lehr Thermocouples Spout Bowl Thermocouples Glass Level Probes Fish-Hook Thermocouples

► REFRACTORY THERMOCOUPLES

Type	: G, C, D (operating temperature upto 2300°C)
Sheath Material	: Platinum, Rhodium, Tantalum, Rhenium, Molybdenum, Inconel 600, Ceramic etc.
Sheath Dia	: 1.6, 3.2, 6.4, 8.0 mm
Standard Transition Sleeve	: SS316 or INCONEL
Insulation Material	: Magnesium Oxide, Aluminium Oxide, Beryllium Oxide, Hafnium Oxide

RESISTANCE TEMPERATURE DETECTORS

High Accurate RTDs for General and Critical applications

► RTDs WITH THERMOWELLS/PROTECTION TUBES

Type	:	Pt 100, 200, 500, 1000 etc.
Element size (MI)	:	Wire wound ceramic encapsulated Wire wound glass encapsulated Thin film ceramic encapsulated
Connection	:	2, 3, 4, wire
Accuracy	:	Class A, B, 1/2, 1/3, 1/5, 1/10, DIN
Protection Sheath	:	SS304, SS321, SS316, SS310, Inconel 600/800, HRS 446, Hastalloy, Monel etc.
Configuration	:	Simplex/Duplex/Others

► MINERAL INSULATED RTDs

Type	:	Pt 100, 200, 500, 1000 cu-50, 53 etc.
Connection	:	2, 3, 4 wire
Element Dia	:	1.5, 3, 4.5, 6, 8 mm
Configuration	:	Simplex/Duplex/Others

► SPECIAL RTDs

- Slide shoe bearing RTDs
- Vibration proof RTDs for Bearing & DG sets
- Motor & Transformer winding temperature RTDs
- Handheld & Probe in various designs
- RTDs with IBR approved Thermowells
- Strap on RTDs for nuclear application
- High Temperature RTDs upto 1/10 DIN
- Semi Standard PRTs with NABL Certificate Calibrated on Fixed points suitable up to 661°C (Freezing Point of Al)

THERMOWELLS AND PROTECTION TUBES

A wide choice of thermowells and variety of protection tubes like Refractory, Stainless Steel, special Ni alloy protection tubes are available for various applications

► THERMOWELLS

Material	: SS304, SS316, SS316L, SS321, SS310, HRS446, INCONEL 600/800, 601 Hastalloy, Monel, Titanium etc.
Type	: Drilled barstock, Fabricated
Construction	: Tapered, Straight
Process Connection	: Screwed, Flanged
Certification	: IBR certification on request

► SPECIAL THERMOWELLS / PROTECTION TUBES

- Metal Thermowells with Tungsten carbide/Ceramic/PTFE/PVDF/PFA coatings
- Solid sintered tungsten carbide
- Silicon carbide(Recrystallised & Nitride Bonded)
- Platinum thimble
- Tantalum, Titanium, Nickel cladding,
- Tantalum Tungsten (Ta10W) Alloy
- Graphite
- Silicon Nitride
- Other Materials in various sizes available on request

► PROTECTION TUBES

CERAMICS

Material	: Recrystallised Alumina 99.7%
Type	: KER 710(C-799) Open Ended, Close Ended
Length	: 350, 530, 600, 650, 740, 900, 1030, 1200, 1430 mm etc.
OD x ID	: 6x4, 8x5, 10x6, 12x8, 15x10, 20x15, 24x18mm etc.
Insulating Tubes	: 2/4/6 Holes etc.
OD	: 1.5, 2.8, 3.5, 5.5, 8.5 mm etc.

CeramTec
Germany

ACCESSORIES

CONNECTORS

- Plug and jack compensated for thermocouples.
J, K, R, S, B, T, E Types
- Standard, Miniature, Panel mounted, Simplex, Duplex
Material : Glass Filled Nylon and Ceramic
Colour Coding : Various Standards
- Lemo Connectors

CONNECTION HEADS & TERMINAL BLOCKS

- Material : Dia cast Aluminium, Stainless Steel, Plastic etc.
- Type : A, B, AA, DNAG, KNE etc.
- Cable entry : 3/4" ET, 1/2" NPT/BSP
- Protection Class : IP 67, Ex-proof IIA/B, II C

Tempsens offers various types of Terminal Blocks for connection heads.

- Material : Ceramic
- Terminal : Two, Three, Four, Six, Eight

MI Cable

- Type : K, J, T, E, N, R, S, B
- Dia : 0.25, 0.5, 1, 1.5, 2, 3, 4.5, 6 & 8 mm
- Sheath Material : SS316, SS310, Inconel 600, SS446 etc.
others available on request
- Configuration : Simplex/Duplex/Triplex
- Heater MI cable and other available on request.

COMPRESSION FITTING

- Material : AISI- SS316, SS304, SS303, SS321 etc.
- Thread : NPT, BSP, Others
- Size : 1/8" to 1" and Others

OTHER ACCESSORIES

- Flanges
- Seal Pots
- Bayonet Caps
- Holding Tubes

CABLES FOR TEMPERATURE SENSORS & INSTRUMENTATION

Wide range of insulations and conductor configurations are manufactured in house by our cable inhouse manufacturing Facility.

Compensating and Extension Cables for thermocouples J, K, T, E, N, R, S, B Types. RTD Cables in three wire & four wire configuration for simplex and six & eight wire for duplex are available.

Wire Gauge	:	14 to 36 gauge (AWG/SWG)
Conductor	:	Solid / Multistrand
Insulation	:	Single and Double Fibre Glass, PTFE, Ceramic Fibre, Silica Fibre, SS Braided, PVC etc.
Protection	:	Armored / Unarmored

Other Cables for Signal, Control and Instrumentation are available with variety of insulation and various configurations.

WIRE INSULATION IDENTIFICATION AND APPLICATION GUIDE

INSULATION CODE	INSULATION	APPEARANCE OF CABLE	TEMP. RANGE INSULATION	ABRASION RESISTANCE	FLEXIBILITY	WATER SUBMERSION	RESISTANCE TO:	
							FLAME	HUMIDITY
P	Polyvinyl Chloride (PVC)		-40 to 105°C	GOOD	EXCELLENT	GOOD	GOOD	GOOD
EF	FEP		-200 to 200°C	EXCELLENT	GOOD	EXCELLENT	EXCELLENT	EXCELLENT
S	Silicon		-40 to 200°C	GOOD	GOOD	EXCELLENT	GOOD	EXCELLENT
T	PTFE		-267 to 260°C	EXCELLENT	GOOD	EXCELLENT	EXCELLENT	EXCELLENT
PF	PFA		-260 to 260°C	EXCELLENT	GOOD	EXCELLENT	EXCELLENT	EXCELLENT
K	Kapton		-267 to 316°C	EXCELLENT	GOOD	GOOD	EXCELLENT	EXCELLENT
F	Fiber Glass		-73 to 600°C	GOOD	GOOD	POOR	EXCELLENT	FAIR
CF/SF	Ceramic Fiber/ Silica		-72 to 800°C	POOR	GOOD	POOR	EXCELLENT	FAIR
RF/NF	Refrasil/Nextel Silica yarn		-73 to 1200°C	POOR	GOOD	POOR	EXCELLENT	FAIR

INDUSTRIAL HEATERS

► HIGH WATT DENSITY CARTRIDGE HEATERS

Temperature Range :	upto 900°C
Material :	SS304, SS316, Incoloy, (Inconel)
Configurations :	Swaged in Leads, Crimped on Leads, Post terminals, Right Angle Leads, Teflon Seal, Silicon Rubber Seal, Epoxy Seal, Swaged in Braid, Right Angle Stainless Steel Braid, SS Flexible Conduit, Hex head pipe fittings, Flanges etc.

► TUBULAR HEATERS

- Used in various industrial processing such as liquid immersion (with threaded fittings), in free air, clamped on, wrapped around, cast into aluminum, bronze or cast iron.
- Heating banks with customized flange and connections are available with calculation of different parameters using special software.

► CUSTOM BUILT HEATING UNIT

Dutch Heaters

Large Tank Heaters

Circular Heaters

Flanged Immersion Heaters

INDUSTRIAL HEATERS

► SILICON RUBBER HEATERS

- Temperature Range up to 250°C
- High Die Electric Strength, Flame retardant, Non Toxic.
- Easy to install on variety of surface including curved surfaces
- Uniform heating, Adaptability, Long Life
- Good for heating drums, de-icing, vending machines, atms, aircrafts, cars, and maintaining a comfortable temperature in medical equipments, such as CAT scanners.
- Available with inbuilt thermostate / thermocouple/RTD for temperature measurement and control.

► MICA BAND, CERAMIC BAND HEATER & STRIP HEATERS

- Temperature Range upto 450°C
- High Temperature oxidation resistant metal sheath
- High grade mica insulation provides excellent electrical insulation at high temperatures and is resistant to moisture.
- Uniform Heating, Reliable, Accurate.
- Energy saving heaters with outer insulation cover.

► MINERAL INSULATED HEATING CABLES

- Available in Different sheath material - SS304, SS316, SS310, INCONEL 600
- Surface temperature upto 1000°C
- Cables are suitable for heating tanks, valves, pipes, immersion heaters, pumps, tools and industrial process heating systems.
- Available in different customized size and termination

Typical Application

NON-CONTACT PYROMETERS

GAUGES

TEMPERATURE GAUGES

- **Sensing Elements** : Bi-metal, liquid filled, Gas filled
- **Dial Size** : 63, 80, 100, 150, 250 mm
- **Stem Dia** : 6, 8, 10, 12 mm
- **Range** : Min. -40°C, Max. 650°C
- **Accuracy** : Class 1 as per EN13190
- **Over-Range Protection** : 30% above FSD
- **Standard** : EN13190/IS13211
- **Enclosure Protection** : IP-55, IP-65 (Filled)
- **Connection** : 1/8", 1/4", 3/8", 1/2" BSP/NPT (M/F)
- **Mounting** : Center back, Bottom direct, Every angle mounting
- **Special Feature** :
 - Electric Contact Type Thermometer
 - Dual Scale
 - External Zero Adjustment
 - Gas/Liquid filled with capillary max length upto 30 Mtr
 - Dampening Liquid Glycerin/Silicon oil filled

PRESSURE GAUGES

- **Sensing Elements** : Bourdon Tube, Sealed diaphragm, Compact sealed diaphragm, Schaffer Diaphragm, Capsule Diaphragm
- **Dial Size** : 40, 50, 63, 80, 100, 150, 250 mm
- **Range** : Vacuum, Compound, 0....1Kg/cm² to 0....2100Kg/cm²
- **Accuracy** : ±1% FSD
- **Over-Range Protection** : 30% above FSD
- **Standard** : IS : 3624, EN837
- **Enclosure Protection** : IP-55, IP-65 (Filled)
- **Connection** : 1/8", 1/4", 3/8", 1/2" BSP/NPT (M/F)
- **Mounting** : Bottom/ back direct , Bottom surface, Back panel, Back bracket mounting
- **Special Pressure Gauges** :
 - Maximum reading pointer pressure gauge
 - Homogenizer Pressure Gauge
 - Mud Pressure Gauge
 - Electric Contact Pressure Gauge
 - Dampening Liquid Glycerin/Silicon oil filled

FURNACE MONITORING SYSTEM

Furnace Monitoring Cameras with retractable facility are available for various Industrial Applications.

- System for high temperature areas in Steel, Glass, Cement and Power Industries.
- Special Cameras and lenses, Furnace Probes, Regulating and Control Equipments
- Normal And Thermal view Options

FURNACES

Tempsens Linn Thermal Solutions Pvt. Ltd. is a joint venture company between Linn High Therm, Germany & Tempsens Instruments India for manufacturing Laboratory Furnaces, Induction Heating Furnaces & Microwave Furnaces.

► LABORATORY FURNACES & SHUTTLE KILN FOR CERAMICS

Standard laboratory, chamber, and tube furnaces, rotary tube furnaces; all systems available with protective gas and vacuum.

Type : LM, VMK, KK, KK-H etc.

Max. Temperature : Upto 1800°C

For universal application easy operation with wide temperature available with vacuum & gas environment

► INDUCTION HEATING

High/Medium frequency generators/inverters with power up to 400 kW for brazing, soldering, hardening, melting, bonding, preheating, and shrinking.

Heating systems for crystal growing, plasma, excitation, testing equipment, surface modifications in research, development, and production.

Application

Sample Preparation for Spectroscopy

Induction heated sample preparation machines for spectroscopy for remelt and fusion of oxidic materials, metals, development of alloys and standards. Suited for XRF/RFA, Emission, AAS, ICP, X-Emission.

Casting Application

Casting machines for all metals incl. Ti, TiAl, Mg and alloys used in industry, jewelry, dental, and for medical implants. Casting weights up to 3000 g.

► TUBE & ROTARY TUBE FURNACE

Special tube furnace for the heat treatment of steel sheet under protective gas. 5 zone heating. Insert tubes radially arranged. Water cooled end flanges. Protective gas inlet in the middle of the furnace.

► MICROWAVE FURNACE

Batch and continuous microwave systems for applications in drying and sterilizing of bulk materials, insulation materials, pharmaceutical products, technical ceramics and natural produce. Other applications include hardening of plastics, debinding and sintering units for ceramics and sintered metals, as well as flow heaters.

Note: We can design & manufacture a wide range of custom built Products as per process requirement of the customer.

CALIBRATION BATHS

Calibration baths and master sensors to fulfil most demanding temperature calibration requirements are available in different models right from -80°C to 1700°C. Customer can choose suitable bath to fulfill their needs.

Model	Range	Stability
BATH		
CALsys -80/50	-80....+50°C	±0.1°C
CALsys -40/200	-40....+200°C	±0.01°C
CALsys 250	50....+250°C	±0.1°C
DRY BLOCK		
CALsys -15/110	-15.... +110°C	±0.1°C
CALsys 650	50.... +650°C	±0.1°C
CALsys 1200	250...+1200°C	±0.5°C
CALsys 1200L	300...+1200°C	±0.5°C
CALsys 1500L	500...+1500°C	±1.0°C
CALsys 1700L	500...+1700°C	±2.0°C
BLACKBODY		
CALsys -15/110BB	-15.....+110°C	±0.1°C
CALsys 500 BB	50.....+500°C	±1.0°C
CALsys 1200 BB	300....+1200°C	±0.5°C
FAST CAL 1200	300....+1200°C	±1.0°C
CALsys 1500 BB	500....+1500°C	±1.0°C
CALsys 1700 BB	500....+1700°C	±2.0°C
FAST CAL 2600	700....+2600°C	±3.0°C

► REFERENCE JUNCTION UNIT

- 0°C & 60°C Thermoelectric reference unit
- Eliminates Old Fashioned "Ice Bath"
- Versatile use in industries, Laboratories, Instrument Shop
- NABL Traceable Calibration Available

Type	Channel	Ref. Temp.	Type of Junction
CALref 0	20	0°C	J,K,T,E,N,R,S,B
CALref 60	24	60°C	J,K,T,E,N,R,S,B

MASTER SENSORS

Highly Accurate Master Temperature Sensors in various configuration are available with Calibration certificate from NABL Accredited in house Lab.

- SSPRT
- RTD : Pt 100
 - Accuracy : 1/10, 1/5, 1/3, 1/2 DIN, Class A
 - Sheath Material : SS316/ Inconel/Quartz
- Thermocouple : K/N/R/S
 - Accuracy : Special, Class 1, with Cold junction compensation
 - Sheath Material : Inconel/Ceramic (KER 710-C 799)

TEMPERATURE CONTROL & INDICATORS

► TEMPERATURE INDICATORS / CONTROLLERS

Size	: 48 x 96 mm
Input signal type	: mA, mV, full scale/zero adjustable
Output	: Relay Output, 4-20mA(retransmission)
Auxiliary Power supply	: 24V, 30mA
Accuracy	: $\pm 0.3\%$ FS
Digital Communication	: RS 485

► HAND HELD TEMPERATURE INDICATORS

- Indicators for K type Thermocouple
Model : Tempmet 05 - 1 channel
- For Thermocouples – R,S,K,N,J,T type
Model : Tempmet 02 - 1 channel
Tempmet 04 (with datalogger)– 4 channels,
Tempmet 05 (with datalogger)– 1 channel
- For RTDs– Pt 100, 200, 500, 1000
Model : Tempmet 01 - 1 channels
- For All types of Thermocouples & RTDs
Model : Tempmet 03 (with datalogger) - 2 channels

Tempmet 01

Tempmet 05

► TEMPERATURE TRANSMITTER

- Head Mounted Transmitter with SMART
- Head Mounted Transmitter with HART Protocol
- Din Rail Mounted Transmitter with HART Protocol
- Field Mounted Transmitter

► PAPERLESS RECORDERS

- 6.4" TFT Color LCD with VGA Display in 640x480 pixels.
- 6, 18 isolated Analog Inputs
- Plug & play I/O cards for easy expansion
- Infrared detector to prolong lifetime of LCD
- Ethernet as standard and optional RS-232/422/485 communication
- High accuracy 18-bit A-D Analog Input
- 15-bit D-A Analog Output.

Thermocouples

A

Thermocouple Fundamental

1.1 Introduction

Thermocouples are pairs of dissimilar metal wires joined at one end, which generate a net thermoelectric voltage between the open pair according to the temperature difference between the ends.

The junction that is put into the process in which temperature is being measured is called the HOT JUNCTION. The other junction which is at the last point of thermocouple material and which is almost always at some kind of measuring instrument is called the COLD JUNCTION.

Thermocouples are available either as bare wire ('bead' thermocouples) which offer low cost and fast response times, or built into probes. A wide variety of probes are available, suitable for different measuring applications (industrial, scientific, food temperature, medical research etc).

1.2 The Seebeck Effect

In 1821 a German physicist named Seebeck discovered the thermoelectric effect, which forms the basis of modern thermocouple technology. He observed that an electric current flows in a closed circuit of two dissimilar metals if their two junctions are at different temperatures. The thermoelectric voltage produced depends on the metals used and on the temperature relationship between the junctions. If the same temperature exists at the two junctions, the voltage produced at each junction cancel each other out and no current flows in the circuit. With different temperatures at each junction, different voltages are produced and current flows in the circuit. A Thermocouple can therefore only measure temperature differences between the two junctions.

It is important to designate each of the junctions for practical purposes; the measuring junction (often referred to as the 'hot' junction) is that which is exposed to be measured temperature. The reference junction is the other junction that is kept at a known temperature; this is often referred to as the 'cold' junction. The term thermocouple refers to the complete system for producing thermal voltages and generally implies an actual assembly (i.e. a sheathed device with extension leads or terminal blocks).

The two conductors and associated measuring junction constitute a thermo element and the individual conductors are identified as the positive or negative leg.

The change in material EMF with respect to a change in temperature is called the Seebeck coefficient or thermoelectric sensitivity. This coefficient is usually a nonlinear function of temperature.

Law of Successive Thermocouple

One thermocouple has its measuring point at T1 and open end at T2. The second thermocouple has its measuring point at T2 and its open end at T3. The third thermocouple has its measuring point at T3. The emf level for the thermocouple that is measuring T1 is e1; that for the other thermocouple is e2; and for the last thermocouple is e3. The sum of the three EMF's e1, e2, e3, equals the EMF 'e' that would be generated by the combined thermocouple operating between T1 & T4.

Hence a thermocouple is a sum of many thermocouples. For eg. An EMF produced by a thermocouple with hot junction at T1 & cold at T4; The EMF generated will be equal to many thermocouples joined together and produced EMF would be equals to sum of these three EMF e1, e2, e3.

$$e = e_1 + e_2 + e_3$$

The characteristics of the thermocouple alloy should be uniform for the full length of thermocouple.

Note : Thermocouple is always formed when two metals are connected together. For example, when the Thermo element conductors are joined to copper cable or terminals, thermal voltages can be generated at the transition. In this case, the second junction can be taken as located at the connection point (assuming the two connections to be thermally common). The temperature of this connection point (terminal temperature) if known, allows computation of the temperature at the measuring junction. The thermal voltage resulting from the terminal temperature is added to the measured voltage and their sum corresponds to the thermal voltage against a 0°C reference.

If the measuring junction is at 300°C and the terminal temperature is 25°C, the measured thermal voltage for the type K thermo element (Nickel-Chromium v Nickel-Aluminum) is 11.18 mV. This corresponds to 275°C difference temperature. Therefore a positive correction of 25°C refers the temperature to 0°C reference; 300°C is thus indicated.

Important points to note at this stage are four-fold.

1. Thermocouples only generate an output in the regions where the temperature gradient exists- not beyond.
2. Accuracy and stability can only be assured if the thermoelectric characteristics of the thermocouple conductors are uniform throughout.
3. Only a circuit comprising dissimilar materials in a temperature gradient generates an output.
4. Although the thermoelectric effects are seen at junctions, they are not due to any magic property of the junction itself.

1.3 Cold Junction Compensation

A practical industrial or laboratory Thermocouple consists of only a single (measuring) junction; the reference is always the terminal temperature.

Possible measures are:-

- a) Measures the terminal temperature accurately and compensate accordingly in calculating the measured value.
- b) Locate the terminals in a thermally controlled enclosure.
- c) Terminate not in copper cable but use compensating or actual thermocouple wire to extend the sensor termination to the associated instrumentation (compensating cable uses low cost alloys, which have similar thermoelectric properties to the actual thermoelement). On this basis, there is no thermal voltage at the thermocouple termination. The transition to copper then occurs only at the instrument terminals where the ambient temperature can measure by the instrument; the reference junction can then be compensated for electronically.

Thermoelement with compensating cable

Note :- It is essential to use only compensating or specific extension cables (these have the correct thermoelectric properties) appropriate to the thermocouple other wise an additional thermocouple is formed at the connection point. The reference junction is formed where the compensating or extension cable is connected to a difference material. The cable used must not be extended with copper or with compensating cable of a different type.

d) Use a temperature transmitter at the termination point. This is effectively bringing instrumentation close to the sensor where electronic reference junction techniques can be utilized. However, this technique is convenient and often used in plant; transmitter produces an amplified "corrected" signal, which can be sent to remote instruments via copper cable of any length.

Temperature Transmitter 2- wire

1.4 Measuring Junctions

Three alternative tip configurations are usually offered:

- An exposed** (measuring) junction is recommended for the measurement of flowing or static non-corrosive gas temperature when the greatest sensitivity and quickest response is required.
- An insulated** junction is more suitable for corrosive media although the thermal response is slower. In some applications where more than one thermocouple connects to the associated instrumentation, insulation may be essential to avoid spurious signals occurring in the measuring circuits. If not specified, this is the standard.
- An earthed** (grounded) junction is also suitable for corrosive media and for high pressure applications. It provides faster response than the insulated junction and protection not offered by the exposed junction.

1.5 Method of Formation of Hot Junction

To form the hot junction, a suitable method has to be adopted to obtain a good electrical contact between the thermocouple wires.

For Chromel/Alumel and other combinations, for use in high temperature measurements, welding is the only method to obtain a suitable joint.

For this purpose Tig welding & Laser beam welding is mostly used.

Tig welding

Gas tungsten arc welding (GTAW), also known as tungsten inert gas (TIG) welding, is an arc welding process that uses a nonconsumable tungsten electrode to produce the weld. The weld area is protected from atmospheric contamination by a shielding gas.

Laser beam welding

Laser beam welding (LBW) is a welding technique used to join multiple pieces of metal through the use of a laser. The beam provides a concentrated heat source, allowing for narrow, deep welds and high welding rates. LBW is a versatile process, capable of welding carbon steels, HSLA steels, stainless steel, aluminum and titanium. The speed of welding is proportional to the amount of power supplied but also depends on the type and thickness of the workpieces.

1.6 Thermocouple standard

- ✓ ASTM E 235 : Standard Specification for Thermocouples, Sheathed, Type K and Type N for Nuclear or for other High-Reliability Applications.
- ✓ ASTM E 839 : Standard Test Methods for Sheathed Thermocouples and Sheathed Thermocouple Materials.
- ✓ ASTM E 220 : Test Methods for Calibration of Thermocouples by Comparison Techniques
- ✓ ASTM E 230 : Specification and Temperature-EMF Tables for Standardized Thermocouples.
- ✓ ASTM E 585 : Standard specification for compacted MI, MS, base metal thermocouple cables.
- ✓ ASTM E 608 : Standard specification for compacted MI, MS, base metal thermocouples.
- ✓ ASTM E 696 : Standard specifications for tungsten - rhenium alloy thermocouple wire.
- ✓ ASTM E 1652 : Standard specification for Magnesium oxide & Alumina oxide powder & crushable insulators used in metal sheathed PRT's, base metal thermocouples & noble metal thermocouple.
- ✓ IS 12579 : Specification for Base Metal Mineral Insulated Thermocouple Cables and Thermocouples.
- ✓ GB/T 1598 - 2010 : Chinese standard for platinum thermocouples.
- ✓ IEC 584 : International standard for thermocouples.

1.7 Types of thermocouple

Many combinations of materials have been used to produce acceptable thermocouples, each with its own particular application spectrum. However, the value of interchangeability and the economics of mass production have led to standardization, with a few specific types now being easily available, and covering by far the majority of the temperature and environmental applications.

These thermocouples are made to conform to an e.m.f/ temperature relationship specified in the form of tabulated values of e.m.fs resolved normally to 1mV against temperature in 1C intervals, and vice versa. Internationally, these reference tables are published as IEC 584 1, 2 & 4, which is based on the International Temperature Scale ITS-90. It is worth noting here, however, that the standards do not address the construction or insulation of the cables themselves or other performance criteria. With the diversity to be found, manufacturers' own standards must be relied upon in this respect.

The standard covers the eight specified and most commonly used thermocouples, referring to their internationally recognized alpha character type designation & providing the full reference tables for each. These thermocouple types can be subdivided in 3 groups, base metal, noble (rare) metal & Refractory metal thermocouple.

1.7.1 Base Metal Thermocouples

Base metal thermocouple types are composed of common, inexpensive metals such as nickel, iron and copper. The thermocouple types E, J, K, N and T are among this group and are the most commonly used type of thermocouple.

Each leg of these different thermocouples is composed of a special alloy, which is usually referred to by their common names.

Type E – The type E thermocouple is composed of a positive leg of chromel (90%nickel/10%chromium) and a negative leg of constantan (45%nickel/55% copper). The temperature range for this thermocouple is -200 to 900°C (-330 to 1600 °F). The type E thermocouple has the highest millivolt (EMF) output of all established thermocouple types. Type E sensors can be used in sub-zero, oxidizing or inert applications but should not be used in sulphurous, vacuum or low oxygen atmospheres.

Type J – Type J thermocouples have an iron positive leg and a constantan negative leg. Type J thermocouples have a useful temperature range of 0 to 750°C (32 to 1400 °F) and can be used in vacuum, oxidizing, reducing and inert atmospheres. Due to the oxidation (rusting) problems associated with the iron leg, care must be taken when choosing this type for use in oxidizing environments above 537 °C.

Type K – The type K thermocouple has a Chromel (90% nickel/10% copper) positive leg and an Alumei (95%nickel/5% manganese, aluminum and silicon) negative leg. The temperature range for type K alloys is -200 to 1250°C (-328 to 2282 °F). Type K sensors are recommended for use in oxidizing or completely inert environments. Type K and type E should not be used in sulfurous environments. Because type K has better oxidation resistance than types E, J and T, its main area of usage is at temperatures above 600°C but vacuum and low oxygen conditions should be avoided.

Type N – Type N thermocouples are made with a Nicrosil (74.1%nickel – 14.4% chromium – 1.4 % silicon.0.1%magnesium) positive leg and a Nisil (95.6%nickel – 4.4% silicon) negative leg. The temperature range for Type N is -270 to 1300°C (-450 to 2372°F). Type N is very similar to Type K except that it is less susceptible to selective oxidation. Type N should not be used in vacuum and or reducing environments in an unsheathed design.

Type T – Type T thermocouples are made with a copper positive leg and a constantan negative leg. The temperature range for type T is -200 to 350°C (-328 – 662°F). Type T sensors can be used in oxidizing (below 350°C), reducing or inert applications.

1.7.2 Noble Metal Thermocouples

Noble metal thermocouples are manufactured with wire that is made with precious or “noble” metals like Platinum and Rhodium. Noble metal thermocouples can be used in oxidizing or inert applications and must be used with a ceramic protection tube surrounding the thermocouple element. These sensors are usually fragile and must not be used in applications that are reducing or in applications that contain metallic vapors.

Type R – Type R thermocouples are made with a platinum/13% rhodium positive leg and a pure platinum negative leg. The temperature range for type R is 0 to 1450°C (32 – 2642 °F)

Type S – Type S thermocouples are made with a platinum/10% rhodium positive leg and a pure platinum negative leg. The temperature range for type S is 0 to 1450°C (32 – 2642 °F).

Type B – Type B thermocouples are made with a platinum/30% rhodium positive leg and a platinum/6% Rhodium negative leg. The temperature range for type B is 0 to 1700°C (32 – 3092°F).

1.7.3 Refractory Metal Thermocouples

Refractory metal thermocouples are manufactured with wire that is made from the exotic metals tungsten and Rhenium. These metals are expensive, difficult to manufacture and wire made with these metals are very brittle. These thermocouples are intended to be used in vacuum furnaces at extremely high temperatures and must never be used in the presence of oxygen at temperatures above 300°C. There are several different combinations of alloys that have been used in the past but only one generally used at this time.

Type C – The type C thermocouple is made with a tungsten/5% rhenium positive leg and tungsten 26% rhenium negative leg and has a temperature range of 0 – 2320°C (32 – 4208 °F).

Type G- Type G thermocouple technically also known as WM26Re. The type G thermocouple has alloy combination of tungsten (W) as positive lead and tungsten + 26% Rhenium (W-26% Re) as negative lead. Maximum useful temperature range of this thermocouple is 0 to 2320°C.

Type D- Type D thermocouple technically also known as W3ReM25Re. Type D thermocouple has alloy combination of tungsten + 3% rhenium (W-3%Re) as positive lead and tungsten + 25 % Rhenium (W-56% Re) as negative lead. Maximum useful temperature range of this thermocouple is 0 to 2320°C.

Thermocouple Type	Material + & -	Temperature Range(°C)	Application
E	Chromel & Constantan (Ni-Cr & Cu-Ni)	-200 to 900°C	Inert media, Oxidizing media
J	Iron & Constantan (Fe & Cu-Ni)	0 to 750°C	Inert media, Oxidizing media, Reducing media Vacuum
K	Chromel & Alumel (Ni-Cr & Ni-Al)	-200 to 1250°C	Inert media, Oxidizing media
N	Nicrosil & Nisil (Ni-Cr & Ni-Si)	-270 to 1300°C	Inert media, Oxidizing media
T	Copper & Constantan (Cu & Cu-Ni)	-200 to 350°C	Inert media, Oxidizing media, Reducing media Vacuum
R	87% Platinum/ 13% Rhodium & Platinum (Pt & Pt-Rh)	0 to 1450°C	Inert media, Oxidizing media,
S	90% Platinum/ 10% Rhodium & Platinum (Pt & Pt-Rh)	0 to 1450°C	Inert media, Oxidizing media,
B	70% Platinum/ 30% Rhodium & 94% Platinum/ 6% Rhodium (Pt-Rh & Pt-Rh)	0 to 1700°C	Inert media, Oxidizing media,
C	95% Tungsten/ 5% Rhenium & 74% Tungsten/ 26% Rhenium	0 to 2320°C	Vacuum inert and reducing

1.8 Types of Thermocouple Construction

There are two types of thermocouple construction is most commonly used.

Mineral Insulated (M.I.) Thermocouples & Non M.I. Thermocouples

1.8.1 Mineral Insulated Thermocouples

Magnesium Oxide insulated thermocouples, commonly referred as MgO thermocouples, are used in many process and laboratory applications. They are available in all thermocouple element types, a wide variety of sheath diameters and materials, they are rugged in nature and bendable, and their fairly high temperature ratings make MgO thermocouples a popular choice for a multitude of temperature measuring applications.

The many desirable characteristics make them a good choice for general and special purpose applications.

MgO sensors are constructed by placing an element or elements into a sheath of a suitable material and size, insulating the elements from themselves and the sheath with loose filled or crushable Magnesium Oxide powder or insulators, and then swaging or drawing the filled sheath down to its final reduced size. The swaging process produces an element with highly compacted MgO insulation and provides high dielectric strength insulation between the elements themselves and their sheath.

Mineral insulated Thermocouples consist of thermocouple wire embedded in a densely packed refractory oxide powder insulate all enclosed in a seamless, drawn metal sheath (usually stainless steel).

Effectively the thermoelement, insulation and sheath are combined as a flexible cable, which is available in different diameters, usually from 0.25mm to 10mm.

At one end cores and sheath are welded from a "hot" junction. At the other end, the thermocouple is connected to a "transition" of extension wires, connecting head or connector.

Advantages of mineral insulated thermocouple are

- Small over all dimension and high flexibility, which enable temperature measurement in location with poor accessibility.
- Good mechanical strength.
- Protection of the thermo element wires against oxidation, corrosion and contamination.
- Fast thermal response.

The mineral oxides used for insulation are highly hygroscopic and open-ended cables must be effectively sealed (usually with epoxy resins) to prevent moisture take-up. A carefully prepared mineral insulated thermocouple will normally have a high value of insulation resistance (many hundreds of mega ohms).

Mineral Insulated Thermocouple Tip Style

The junction tip of Mineral insulated thermocouple can be of three types as described previously. The tip can be insulated, grounded and reduced type.

- a.) Insulated Tip: Insulated hot end junctions are suitable for most applications, especially where low EMF pick-up is essential. High insulation resistance is enhanced due to extreme compaction of the high purity MgO powder insulation.
- b.) Bonded or grounded junctions offer a slightly faster temperature response than the insulated junction type. Not recommended for multi-point instrumentation.
- c.) Reduced tip junctions are ideal for applications where low mass and extremely fast response times are required, together with good mechanical strength. Reduced tip can be provided on 1.0 to 6.0 mm diameter thermocouples.

Cross section view of M.I. thermocouple

In above figure of M.I. thermocouple, S, I, C represent the terms sheath thickness, insulation, conductor respectively. These values depend upon the outer diameter (D) of M.I. thermocouple.

Sheath thickness (S)	=	10% of D
Conductor (C)	=	15% of D
Insulation (I)	=	08% of D

1.8.2 Non M.I. Thermocouples

In Non-M.I. thermocouples, thermocouple wires are either insulated with ceramic beads or after insulation of ceramic, covered by a metal sheath (usually stainless steel) and some form of termination (extension lead, connecting head or connector for example) is provided. In this type of construction thermocouple wires are protected from the measuring environment when a sheath protection is provided. The sheath material is dependent on the measuring environment usually stainless steel is used. According to the corrosive environment sheath selection is changed.

This construction does not provide flexibility & not found in small sizes. Not too good mechanical strength.

In Non M.I. construction sheath may be of ceramic or metal as per suitability.

Exposed, Grounded and Ungrounded all types of junctions are formed in both the M.I. & Non M.I. construction.

1.9. Characteristics of thermocouple

1.9.1 Tolerances on Temperature Reading

Tolerance denotes the maximum allowable value obtained by subtracting the temperature reading or the temperature at the hot junction from the standard temperature converted from the applicable temperature EMF table.

Type of thermocouple	Tolerance Grade					
	ASTM E230-ANSI MC 96.1			IEC 584-2		
	Temperature range (°C)	Standard	Special	Temperature Range (°C)	Class 1	Class 2
B	800-1700°C	±0.5%	---	600 to 1700°C	±1°C or $\pm\{(1+(T-1100) \times .0.3\%)\}$	±1.5°C or ±0.25%
R & S	0 - 1450°C	±0.5°C or ±0.25%	±0.6°C or ±0.1%	0 to 1600°C	±1°C or $\pm\{(1+(T-1100) \times .0.3\%)\}$	±1.5°C or ±0.25%
N & K	-200-0°C	±2.2°C or ±2%	---	-40 to 1000°C	±1.5°C or ±0.4%	±2.5°C or ±0.75%
	0-1260°C	±2.2°C or ±0.75%	±1.1°C or ±0.4%			
E	-200 - 0°C	±1.7°C or ±1%	---	-40 to 800°C	±1.5°C or ±0.4%	±2.5°C or ±0.75%
	0 - 870°C	±1.7°C or ±0.5%	±1.0°C or ±0.4%			
J	0 - 760°C	±2.2°C or ±0.75%	±1.1°C or ±0.4%	-40 to 750°C	±1.5°C or ±0.4%	±2.5°C or ±0.75%
T	-200 - 0°C	±1.0°C or ±1.5%	---	-40 to 350°C	±0.5°C or ±0.4%	±1°C or ±0.75%
	0 - 370°C	±1.0°C or ±0.75%	±0.5°C or ±0.4%			
C	0 to 2320°C	4.5°C or ±1.0%	---	---	---	---

1.9.2 Maximum Operating Temperature

Operating temperature limit means the upper temperature where thermocouple can be used continuously in air. Maximum limit means the upper temperature where thermocouple can be used temporarily for short period of time owing to unavoidable circumstances. This graph is given as a guide only, and not to be guaranteed.

Principal factors that affect the life of a thermocouple are:

- **Temperature** : Thermocouple life decreases by about 50% when an increase of 50 °C occurs.
- **Diameter** : By doubling the diameter of the wire, the life increases by 2-3 times.
- **Thermic cycling** : When thermocouples are exposed to thermic cycling from room temperature to above 500°C, their life decreases by about 50% compared to a thermocouple used continuously at the same temperature.
- **Protection** : When thermocouples are covered by a protective sheath and placed into ceramic insulators, their life is considerably extended.

For bare wire thermocouple :

Type of Thermocouple	Upper temperature limit for various wire sizes				
	No. 8 AWG 3.25 mm (°C)	No. 14 AWG 1.63 mm (°C)	No. 20 AWG 0.81 mm (°C)	No. 24 AWG 0.51 mm (°C)	No. 28 AWG 0.33 mm (°C)
T	---	370	260	200	200
J	760	590	480	370	370
E	870	650	540	430	430
K	1260	1090	980	870	870
N	1260	1090	980	870	870
R, S	---	---	---	1480	---
B	---	---	---	1700	---

For Mineral Insulated Cables :

Type of Thermocouple	Upper temperature limit for various sheath diameters							
	0.5 mm (°C)	1.0 mm (°C)	1.5 mm (°C)	2.0 mm (°C)	3.0 mm (°C)	4.5 mm (°C)	6.0 mm (°C)	8.0 mm (°C)
T	260	260	260	315	370	370	370	370
J	260	260	440	440	520	620	720	720
E	300	300	510	510	650	730	820	820
K	700	700	920	920	1070	1150	1150	1150
N	700	700	920	920	1070	1150	1150	1150

While application conditions do alter techniques, the following factors are suggested for consideration.

1. Obtain thermocouples with insulated measuring junctions.
2. Specify "same metal" for large installation, preferably close tolerance.
3. Thermocouple reference junction should be monitored in a reference unit with an accuracy of +0.1°C or better.
4. Great care to be taken in running thermocouple circuitry against "Pickup" etc. with the minimum number of joints in the wiring.
5. Heat-treat thermocouple to their most stable condition.
6. Calibrate thermocouples.

1.9.3 Thermocouple Response Times

The response time for a thermocouple is usually defined as the time taken for the thermal voltage (output) to reach 63% of maximum for the step change temperature. It is dependent on several parameters including the thermocouple dimension, construction, tip configuration and the nature of the medium in which the sensor is located. If the thermocouple is plunged in to a medium with a high thermal capacity and heat transfer is rapid, the effective response time will be practically the same as for the thermocouple itself (the intrinsic response time). However, if the thermal properties of the medium are poor (e.g. still air) the response time can be 100 times greater.

For exposed measuring junctions, divide the values shown by 10. Thermocouple with grounded junction display response times some 20 to 30% faster than those with insulated junction. Very good sensitivity is provided by fine gauge unsheathed thermocouples. With conductor diameter in the range 0.025mm to 0.81mm, response times in the region of 0.05 to 0.40 seconds can be realized.

Sheath Outer Diameter (mm)	Types of Measuring Junction	Response Time in Seconds (in sec.)					
		100°C	250°C	350°C	430°C	700°C	850°C
6.00	Insulated	3.2	4.0	4.7	5.0	6.4	16.0
6.00	Earthed	1.6	2.0	2.3	2.5	3.15	8.0
3.00	Insulated	1.0	1.1	1.25	1.4	1.6	4.5
3.00	Earthed	0.4	0.46	0.5	0.56	0.65	1.8
1.5	Insulated	0.25	0.37	0.43	0.50	0.72	1.0
1.5	Earthed	0.14	0.17	0.185	0.195	0.22	0.8
1.00	Insulated	0.16	0.18	0.19	0.21	0.24	0.73
1.00	Earthed	0.07	0.09	0.11	0.12	0.16	0.6

Values shown are for a closed end sheath.

1.9.4 Immersion Length

Thermocouple assemblies are "tip" sensing devices which lends them to both surface and immersion applications depending on their construction. However immersion type must be used carefully to avoid error due to stem conduction from the process which can result in a high or low reading respectively. A general rule is to immerse into the medium to a minimum of 4 times the out side diameter of them sheath; no quantitative data applies but care must be exercised in order to obtain meaningful results.

The ideal immersion depth can be achieved in practice by moving the probe in to or out of the process medium incrementally; with each adjustment, not any apparent change in indicating temperature. The correct depth will result in no change in indicating temperature.

1.9.5 Surface Temperature Measurement

Although thermocouple assemblies are primarily tip sensing devices, the use of protection tubes renders surface sensing impractical. Physically, the probe does not lend it self to surface presentation and steam conduction would cause reading errors. If thermocouple is to be used reliably for surface sensing, it must be either exposed, welded junction from with very small thermal mass or be housed in a construction, which permits true surface contact when attaching to the surface. Locating a thermocouple on a surface can be achieved in various ways including the use of an adhesive patch, a washer and stud, a magnet for ferrous metal and pipe clips.

1.10. Advantage of Thermocouple

Industrial thermocouple, in comparison with other thermometers, has the following features:

1. Quick response and stable temperature measurement by direct contact with the measuring object.
2. If the selection of a quality thermocouple is properly made, wide range of temperature can be measured.
3. Temperature of specific spot or small space can be measured.
4. Since temperature is detected by means of EMF generated, measurement, adjustment, amplification, control, conversion and other data processing are easy.
5. Less expensive and better interchangeability in comparison with other temperature sensors.
6. The most versatile and safe for measuring environments, if a suitable protection tube is employed.
7. Rugged construction and easy installation.

1.11 Applications of Thermocouple

Thermocouples are suitable for measuring over a large temperature range, up to 2300 °C. They are less suitable for applications where smaller temperature differences need to be measured with high accuracy, for example the range 0–100 °C with 0.1 °C accuracy. For such applications thermistors and resistance temperature detectors are more suitable. Applications include temperature measurement for kilns, gas turbine exhaust, diesel engines, and other industrial processes.

Some other applications are as follows :

1. Steel Industry
2. Cement Industry
3. Pharmaceutical Industry
4. Petrochemical Industry
5. Nuclear Industry
6. Power Industry
7. Laboratories
8. Furnace Industry

RTD Fundamentals

2.1 Introduction

The measurement of temperature using the resistance/ temperature characteristics of various materials were probably first to put use by Sir Williams Siemens in 1871, largely laid the foundations of modern resistance thermometry.

The resistance of material can be obtained from the given formula:

$$R = (\rho \times L) / A$$

Where

R = Resistance (ohms)

ρ = Resistivity (ohm/cm)

L = Length(cm)

A = Cross sectional area(cm^2)

2.2 History Related to Resistance Temperature Detector

Sir William Siemens offered the use of platinum as the element in a resistance thermometer. His choice proved most favorable, as platinum is used to these days as the primary element in all high-accuracy resistance thermometers.

Platinum is especially suited to this purpose, as it can withstand high temperatures while maintaining excellent stability. As a noble metal, it shows limited susceptibility to contamination.

The classical resistance temperature detector (RTD) construction using platinum was proposed by C.H. Meyers in 1932. He used a helical coil of platinum on a crossed mica web and mounted the assembly inside a glass tube. This construction minimizes strain on the wire while maximizing resistance.

Although this construction produces a very stable element, the thermal contact between the platinum and the measured point is quite poor. This results in a slow thermal response time. The fragility of the structure limits its use today primarily to that of a laboratory standard.

Another laboratory standard has taken the place of Meyers' design. This is the bird-cage element proposed by Evans and Burns. The platinum element remains largely unsupported, which allows it to move freely when expanded or contracted by temperature variations.

Strain-induced resistance changes over time and temperature are thus minimized, and the bird-cage becomes the ultimate laboratory standard. Due to the unsupported structure and subsequent susceptibility to vibration, this configuration is still a bit too fragile for industrial environment.

The platinum wire is bifilar wound on a glass or ceramic bobbin. The bifilar winding reduces the effective enclosed area of the coil to minimize magnetic pickup and its related noise. Once the wire is wound onto the bobbin, the assembly is then sealed with a coating of molten glass.

The sealing process assures that the RTD will maintain its integrity under extreme vibration, but it also limits the expansion of the platinum metal at high temperatures. Unless the coefficients of expansion of the platinum and the bobbin match perfectly, stress will be placed on the wire as the temperature changes, resulting in a strain-induced resistance change. This may result in a permanent change in the resistance of the wire. There are partially supported versions of the RTD which offer a compromise between the bird-cage approach and the sealed helix. One such approach uses a platinum helix threaded through a ceramic cylinder and affixed via glass-frit. These devices will maintain excellent stability in moderately rugged vibrational applications.

2.3 Resistance Temperature Detector (RTD)

2.3.1 Introduction

The RTDs resistance vs temperature characteristics are stable, reproducible, and have a near linear positive temperature coefficient from 200 to 800 °C. These attributes establish RTDs as a de-facto industry standard. Temperature is determined by measuring resistance and then using the RTD's R vs T. characteristics to extrapolate temperature. The superior sensitivity and stability of these devices, in comparison to thermocouples, give them important advantages in low and intermediate temperature ranges. In addition, resistive devices often simplify control and readout electronics.

Resistance thermometers may be called RTD's (resistance temperature detectors), PRT's (platinum resistance thermometers), or SPRT's (standard platinum resistance thermometers).

The chemical stability, availability in pure form, and highly reproducible electrical properties, has made Platinum the metal of choice for RTD's which are made of either IEC/DIN-grade platinum or reference-grade platinum. The difference lies in the purity of the platinum. The IEC/DIN standard is pure platinum that is intentionally contaminated with other platinum.

Equation of RTD

At 0 °C, A platinum RTD has a resistance of 100 Ω & a temperature co-efficient of about 0.00385 Ω/Ω/°C. These non-linearities are described in **Callender- Van Duesen** equation. This equation consists of both a linear portion & a non-linear portion.

$$\text{Range } -200 \text{ to } 0^\circ\text{C} : R(t) [\Omega] = R_0 (1 + At + Bt^2 + C(t - 100^\circ\text{C})t^3)$$

$$\text{Range } 0 \text{ to } 850^\circ\text{C} : R(t) [\Omega] = R_0 (1 + At + Bt^2)$$

With: R_0 is resistance at 0 °C

$$A = 3,9083 \times 10^{-3} ^\circ\text{C}^{-1}$$

$$B = -5,775 \times 10^{-7} ^\circ\text{C}^{-2}$$

$$C = -4,183 \times 10^{-12} ^\circ\text{C}^{-4}$$

TEMPERATURE COEFFICIENT OF RESISTANCE (α)

Temperature Coefficient of Resistance (TCR) has many definitions. For resistance thermometers, TCR is normally defined as the average resistance change per °C over the range 0 to 100°C, divided by R_0 .

TCR values for the common elements are:

$$\text{TCR } (\alpha) (\Omega/^\circ\text{C}) = (R_{100} - R_0) / (100 \times R_0)$$

Where,

$$\alpha = \text{Temperature Coefficient } (\Omega/\Omega/^\circ\text{C})$$

$$R_{100} = \text{RTD resistance at } 100^\circ\text{C}$$

$$R_0 = \text{RTD resistance at } 0^\circ\text{C}$$

TCR values for the common elements are:

$$\text{Copper} = \{(12.897 - 9.035) / (9.035)\} / (100) = 0.00427 \, \Omega / \Omega/^{\circ}\text{C}$$

$$\text{Nickel- Iron} = \{(917.33 - 604) / 604\} / (100) = 0.00518 \, \Omega / \Omega/^{\circ}\text{C}$$

$$\text{Nickel} = \{(200.64 - 120) / 120\} / 100 = 0.00672 \, \Omega / \Omega/^{\circ}\text{C}$$

$$\text{Platinum} = \{(138.50 - 100) / 100\} / 100 = 0.003850 \, \Omega / \Omega/^{\circ}\text{C}$$

There are four primary curves specified for platinum:

1. $0.003926/^{\circ}\text{C}$: Standard platinum resistance thermometers are the only PRT's that can achieve this TCR. They must have high purity platinum wire (99.999% or better) wound in a strain-free configuration.
The stresses introduced in manufacturing, lower the TCR of ordinary industrial models.
Several manufacturers offer industrial platinum thermometers with nominal TCR of 0.00392; TCR's around 0.003923 are achieved regularly.
2. $0.003911/^{\circ}\text{C}$: This TCR is sometimes called the "U.S. Industrial Standard." Ceramic elements impose strain on platinum wire. It is lower than laboratory standards as the typical construction of high temperature.
3. $0.00385/^{\circ}\text{C}$: DIN 43760, IEC 751, and other national and international specifications mandate this TCR.
4. $0.00375/^{\circ}\text{C}$: Elements with 0.00375 TCR, intended for low-cost applications.

There are few inherent advantages in specifying any particular TCR over another. Laboratory systems traditionally use reference standards with the highest-grade platinum, but industrial specify may aim instead for the greatest degree of standardization. In this case, 0.00385 TCR will be compatible with the length number of manufacturers.

2.3.2 RTD Materials

The criterion for selecting a material to make an RTD is:

- ✓ The material must be malleable so that it can be formed into small wires
- ✓ It must have a repeatable and stable slope or curve.
- ✓ The material should also be resistant to corrosion.
- ✓ The material should be low cost.
- ✓ It is preferred that the material have a linear resistance verses temperature slope.

Some of the common RTD materials are platinum, copper, nickel, Balco (an alloy of 70% nickel and 30 % iron). These metals have the advantage that they can be manufactured to a very high degree of purity and are, consequently, available with highly reproducible temperature/resistance characteristics. These metals can also be drawn to a fine diameter wires required in resistance thermometry.

Table 2.2: Characteristics of several metals used as RTD

Element Material	Temperature Range($^{\circ}\text{C}$)	Resistance Ratio(R_{100}/R_0)	Resistivity $\times 10^{-8}(\Omega\cdot\text{m})$	Relative Cost	Linearity Deviation (0-100 $^{\circ}\text{C}$)
Platinum	-200 to 850	1.3925 to 1.385	11	1100	+0.12
Copper	-200 to 260	1.427	1.72	1	0
Nickel	-80 to 300	1.672	7.8	20	-1.61
Balco	-200 to 230	1.518	20	15	-1.17

As shown in table, although copper is cheapest, it also has the lowest resistivity and therefore requires inconveniently large sensing elements. On the other hand, even as nickel and nickel alloy have high resistivity, their resistance versus temperature coefficients are non-linear. They are also sensitive to strain and their resistivities suffer from an inflexion around the Curie point (358°C) that makes the deviation of their resistance/ temperature expressions more complicated.

This platinum which not only has a high resistivity (more than six times that of copper) but also a high degree of stability and a wide temperature range. Although platinum is expensive it can be drawn into fine wires or strips and we only require small amounts for manufacturing RTDs. As a noble metal, it has minimum susceptibility to contamination.

The presence of impurities is undesirable since diffusion, segregation and evaporation may occur in service, resulting in a lack of stability. The resistivity is also sensitive to internal strains. Thus, it is essential that the platinum should remain in a fully annealed condition i.e. it should be annealed at a temperature higher than the maximum temperature of service.

2.3.3 TEMPERATURE RATING

The maximum temperature rating for RTD's is based on two different factors. First is the element material. Platinum RTD's can be used as high as 650°C (1202°F). Other materials are much lower in temperature rating and vary from material to material. The other determining factor for temperature rating is probe construction. There are construction considerations used in each of these different styles making them ideal for use in each of those ranges. Noone style is good for all ranges.

2.4 Types of RTD:

Platinum RTDs typically are provided in two classes; **Class A** and **Class B**.

Class A is considered high accuracy and has an ice point tolerance of ± 0.06 ohms.

Class B is standard accuracy and has an ice point tolerance of ± 0.12 ohms. Class B is widely used by most industries.

The accuracy will decrease with temperature. Class A will have an accuracy of ± 0.43 ohms ($\pm 1.45^\circ\text{C}$) at 600°C and class B will be ± 1.06 ohms ($\pm 3.3^\circ\text{C}$) at 600°C. The chart below shows the tolerance versus temperature (IEC 751).

Other accuracy classes like 1/3, 1/5, 1/10 of class B are available.

Table 2.3 Tolerance table for type of RTD according to IEC 751

Temperature	1/10 Din ($\pm^{\circ}\text{C}$)	1/5 Din ($\pm^{\circ}\text{C}$)	1/3 Din ($\pm^{\circ}\text{C}$)	Class A ($\pm^{\circ}\text{C}$)	Class B ($\pm^{\circ}\text{C}$)
-100°C	0.080	1.160	0.267	0.350	0.800
-50°C	0.055	0.110	0.183	0.250	0.550
0°C	0.030	0.060	0.100	0.150	0.300
50°C	0.055	0.110	0.183	0.250	0.550
100°C	0.080	0.160	0.267	0.350	0.800

350°C	0.205	0.410	0.683	0.850	2.050
400°C	0.230	0.460	0.767	0.950	2.300

Platinum resistance temperature sensors (PRT) They offer excellent accuracy over a wide temperature range (from -200 to +850°C).

Other resistance value options

RTD elements are also available with resistances of 200, 500, and 1000 Ω at 0°C. Such type of RTDs is normally known as PT200, PT 500, and PT 1000 respectively. These RTDs have the same temperature coefficients as previously described, but because of their higher resistances at 0°C, they provide more resistance change per degree, allowing for greater resolution.

Other standards for Pt 100 Ω RTDs are shown:

Standard	R_{100}/R_0 Ratio
DIN 43760	1.385
U.S. Lab Spec.	1.3926
U.S. Industrial Spec.	1.3911
Canadian Spec.	1.3889
MIL - T -24388	1.3924
Japanese JIS C 1604	1.3916

Standard Platinum RTDs (SPRTs)

The ITS-90 (International Temperature Scale of 1990- used as a worldwide practical temperature scale in national metrology labs like NIST, NPL) is made up of a number of fixed reference points with various interpolating devices used to define the scale between points. A special set of PRTs, called SPRTs, are used to perform the interpolation in such labs over the ranges 13.8033 K (Triple point of Equilibrium Hydrogen) to the Freezing point of silver, 971.78 °C.

2.5 RTD standards

There are two standards for platinum RTDs: The European standard (also known as the DIN or IEC standard) and the American standard.

The European standard, also known as the DIN or IEC standard, is considered the world-wide standard for platinum RTDs. This standard, DIN/IEC 60751 (or simply IEC751), requires the RTD to have an electrical resistance of 100.00 Ω at 0°C and a temperature coefficient of resistance (TCR) of 0.00385 $\Omega/\Omega/^{\circ}\text{C}$ between 0 and 100°C. There are three resistance tolerances for Thin Film

RTDs specified in IEC60751:

Class AA (Formerly 1/3B) = $\pm (0.1 + 0.0017 \times t)^{\circ}\text{C}$ or $100.00 \pm 0.04 \Omega$ at 0°C

Class A = $\pm (0.15 + 0.002 \times t)^{\circ}\text{C}$ or $100.00 \pm 0.06 \Omega$ at 0°C

Class B = $\pm (0.3 + 0.005 \times t)^{\circ}\text{C}$ or $100.00 \pm 0.12 \Omega$ at 0°C

Also, one special class not included in DIN/IEC60751:

Class 1/10B = $\pm 1/10 (0.3 + 0.005 \times t)^{\circ}\text{C}$ or $100.00 \pm 0.012 \Omega$ at 0°C

2.6 Construction of RTD

The RTD elements nearly always require insulated leads attached. At temperatures below about 250 °C PVC, silicon rubber or PTFE insulators are used. Above this, glass fiber or ceramic are used. The measuring point, and usually most of the leads, requires a housing or protective sleeve, often made of a metal alloy which is chemically inert to the process being monitored. Selecting and designing protection sheaths can require more care than the actual sensor, as the sheath must withstand chemical or physical attack and provide convenient attachment points.

RTD's are manufactured in 3 basic types of construction. Each of these different types has advantages and disadvantages.

2.6.1 Platinum Thin Film RTD

The thin film style of RTD is probably the most popular design because of their rugged design and low cost. The thin film element is manufactured by coating a small ceramic chip with a very thin (.0001") film of platinum and then laser cutting or chemical etching a resistance path in the platinum film. The element is then coated with a thin layer of glass to protect it from harmful chemicals and gases.

Larger extension lead wires are spot welded to the chip and this junction is then covered with a drop of epoxy to help hold the wires to the element.

Platinum thin film RTD

2.6.2 Inner coil wire wound RTD

This type of element is normally manufactured using platinum wire. Very small platinum wire (0.02 mm) is coiled and then slid into a small 2 holes ceramic insulator. Larger extension leads are then spot welded to the ends of the platinum wire and cemented in place. Some manufacturers backfill the bores of the insulator with ceramic powder, once the coils have been inserted. This keeps the coils from moving and shorting against each other. The end opposite the extension leads is capped with ceramic cement also.

2.6.3 Outer wound RTD element

The outer wound RTD element is made by winding the sensing element wire around a center mandrill, which is usually made of ceramic. This winding is then coated with glass or some other insulating material to protect and secure the windings. The winding wires are then spot welded to extension leads and secured to the body with ceramic cement or epoxy.

Each of the types has their advantages. The thin film is the least expensive to manufacture and also the most rugged. They can also be manufactured in very small sizes. The inner coil wire wound style is the most accurate. It is however, more expensive to manufacture and does not perform well in high vibration applications. The outer wound element is similar in cost to the inner coil element. It is not as accurate as the inner coil style but is more rugged.

2.7 Lead Wire configurations

RTDs are available with three different lead wire configurations. The selection of lead wire configuration is based on desired accuracy and instrumentation to be used for the measurement.

Two wire RTD

The two wires RTD is the simplest wire configuration. One wire is attached to each side of the element. A measure can be taken by any device equipped to measure resistance, including basic Volt Ohm Meters (VOM).

This is the least accurate way of measuring temperature, due to the fact that the lead wire resistance is in series with the sensing element. The lead wire is at a different temperature than the sensing element and also has different resistance verses temperature characteristics. The longer the lead wire greater will be the effect on the measurement.

Three Wire RTD

The three wires RTD is the most popular configuration for use in industrial applications. In order to minimize the effects of the lead resistances, a three-wire configuration can be used. Using this method the two leads to the sensor are on adjoining arms. There is a lead resistance in each arm of the bridge so that the resistance is cancelled out, so long as the two lead resistances are accurately the same. This configuration allows up to 600 meters of cable.

When used correctly, the three wire configuration eliminates the series resistance. This permits an accurate measurement of the sensing element. Two of the leads are connected to one side of the sensing element and the single lead to the other side. The resistance in L1 and L3 should be matched as close as possible, this will cause the lead resistance to cancel themselves. The color code for a three wire RTD is two red wires and one white.

Four Wire RTD

A four wire RTD is the most accurate method to measure an RTD. It is primarily used in laboratories and is seldom seen in an industrial application. The four-wire resistance thermometer configuration increases the accuracy and reliability of the resistance being measured: the resistance error due to lead wire resistance is zero.

A four wire RTD circuit removes the effect of mismatched resistances on the lead wires. A constant current is passed through L1 and L4, L2 and L3 measure the voltage drop across the RTD element. The color code for a four wire RTD is usually two red wires and two white wires. The following diagram illustrates a typical four wire measurement.

LEAD CONFIGURATION & COLOUR CODE

2 Wire		White Red	Used where lead length is short. There is no compensation for resistance of lead wires.
3 Wire		White Red Red	Most common type of RTD assembly. Typically connected to standard bridge circuit, which allows lead wire resistance to be compensated.
4 Wire		White White Red Red	where higher accuracy is demanded. Lead wire resistance errors are eliminated in this configuration by measuring the voltage across the RTD element supplied with a constant current.

2.8 Mineral Insulated RTD

Mineral-Insulated resistance thermometers (M.I.) are equipped in general with Platinum-measuring resistors Pt100 Ω to DIN IEC 751. The inner (Cu) conductors are embedded in a closely compacted, inert mineral powder (MgO), the measuring resistor will be connected to the inner conductors, is also embedded and is surrounded by the metal sheath to form a hermetically sealed assembly. Some times inner conductor of constantan and nickel are also used.

The sheath functions as a useful protective cover in many situations. They are applied in locations where fast response, reduced space and or vibration resistance is a need. They can be furnished with a fixed cable or with a special plug which allows rapid fitting or exchange.

Mineral-insulated RTD temperature probes consist of a flexible, thin-walled stainless steel mineral-insulated cable, in which low ohmic conductor copper wires are embedded in pressed, heat resistant magnesium oxide.

The temperature probe is connected to the wires of the internal conductors and accommodated in a stainless steel sheath. Thermo- well and mineral-insulated cable are welded to one another.

The good heat transition between the sheath and the temperature probe permits short response times and high measuring accuracy. The vibration resistant (shake proof) design guarantees a long operating life. Temperature measurements at measuring points difficult to access are possible thanks to the flexible mineral-insulated cable. The smallest bending radius is 5 times the outer diameter.

Metal sheathed RTD

- 1) It comprises of a thin-walled and flexible mineral insulated sheath cable made up of stainless steel.
- 2) The cable contains low resistance inner wires made of copper embedded in pressed fireproof magnesium oxide.
- 3) The temperature sensor is connected to the inner wires and fitted in a protective tube.
- 4) Protective tube and sheathed cable are welded together hermetically.
- 5) Good heat transfer between protective tube and temperature sensor allows fast response time and high measuring accuracies.
- 6) The flexible probe tube allows temperature measurement at locations that are not easily accessible.
- 7) They are used in difficult measurement application with strong vibrations as well as at all measuring positions where flexibility and ease of replacement are needed.
- 8) Areas of application are to be found in chemical plants, power stations, motors, as well as in machine construction and building installation and in general industrial applications.

2.9 Potential Sources of Error with Resistance Thermometers

Resistance thermometer systems are susceptible to three types of errors: The inherent tolerances built into the thermometers, gradients between the thermometer and the medium to be sensed, and errors introduced along the path between the sensor and readout or control instrument. Some sources of error are electrical; others result from the mechanical construction of the thermometer.

Interchangeability/Conformity:

Conformity specifies the amount of resistance a thermometer is allowed to deviate from a standard curve (such as the curve produced by the Callendar-Van Dusen equation).

A tolerance at the reference temperature, usually 0°C , and a tolerance on the slope or TCR. Below shown figure states that a resistance thermometer conforms most closely to its curve at the reference temperature, while the resistance fans out above and below this reference.

For example, IEC 751, Class B, requires calibration within 0.12 (0.3°C) at 0°C , but allows TCR to deviate from nominal 0.00385 by $\pm 0.000012/^{\circ}\text{C}$. Thus, tolerance spreads to 0.8°C at 100°C , 1.3°C at 200°C , and on up to 3.8°C at 700°C . Interchangeability between two thermometers is no more than twice the value of there Conformity. Commercial platinum resistance thermometer elements are available with extremely tight tolerances, to within 0.026°C in some cases. When interchangeability is an overriding consideration, the specified may consider other means to achieve it. For example, manufacturers may alter their calibration procedures to fix the reference temperature and tightest tolerance at a point other than 0°C .

Sensitivity

The resistance change per degree change in temperature is a function of base resistance and TCR (Temperature Coefficient of Resistance).

Although a thermometer with higher sensitivity is not necessarily more accurate, a larger signal simplifies output electronics and is less susceptible to lead wire effects and electrical noise. In addition, a larger resistance produces the same voltage output with less measuring current, which helps to limit self heating of the thermometer element.

Insulation Resistance

If the sensing element and leads are not completely insulated from the case, a shunting effect occurs in which the case becomes a parallel resistor and lowers apparent readings. In most industrial thermometers, with specified insulation Resistances in the 100-MΩ ranges, error approaches zero. The manufacturer must take care to seal water-absorbing materials. The shunting effect decreases with low-resistance elements, which accounts. The shunting effect decreases with low-resistance elements, which accounts for the use of 25.5 PRT's in laboratory measurements.

Self-Heating

A resistance thermometer is a passive resistance sensor; it requires a measuring current to produce a useful signal. Because this measuring current heats the element wire above the true ambient temperature, errors will result unless the extra heat is dissipated.

Self-heating is most often expressed in mW/°C, which is the power in mill watts (1000 I² R) required to raise the thermometers internal temperature by 1°C. The higher the mW/°C figure, the lower the self-heating. As an example, assume a 5 mA measuring current is driven through 100 platinum RTD at 100°C. Self-heating is specified as 50 mW/°C in water moving at 3 ft/sec. The amount of heat generated is:

$$1000 \text{ mW} \times (0.005 \text{ A})^2 \times (138.5) = 3.5 \text{ mW}$$

The self-heating error is:

$$(3.5 \text{ mW}) / (50 \text{ mW/°C}) = 0.07^\circ\text{C}$$

The generated heat increases with higher sensor element resistance (when a constant current measurement device is used), or with increasing measuring current.

The resulting error is inversely proportional to the ability of the thermometer to shed extra heat; which in turn depends on thermometer materials, construction, and environment.

The worst self-heating occurs when a high resistance is packed into a small body. Thin film elements, with little surface area to dissipate heat, are an example. Self-heating also depends on the medium in which the thermometer is immersed. Error in still air may be over 100 times greater than in moving water.

Time Constant

A time constant indicates the responsiveness of a resistance thermometer to temperature change. A common expression is the time it takes a thermometer to reflect 63.2% of a step temperature change in moving water. Response speed depends on the mass of the thermometer and the rate at which heat transfers from the outer surface to the sensing element. A rapid time constant reduces errors in a system subject to rapid temperature changes.

Repeatability

The degree of accord between two successive readings with a thermometer is its repeatability. Loss of repeatability results from permanent or temporary changes to the resistance characteristics of the element and may be caused by exposing the thermometer to temperatures at or beyond the endpoints of its specified range. A repeatability test cycles the thermometer between low and high temperatures; any changes to R are noted. A typical repeatability rating for 0°C industrial platinum resistance thermometers is $\pm 0.1^\circ\text{C}$.

Stability

Stability is long-term drift in thermometer readings. A typical specification would limit drift to 0.1°C per year for rated operation. Normal services at points well within the temperature rating typically cause much less drift. Drift is a consequence of the element material, with platinum being the most stable; encapsulating materials, which could contaminate the element; and mechanical stress placed on the element by expansion of winding bobbins or other supporting structures.

Shock and Vibration

Mechanical shock and vibration can alter thermometer readings or cause complete failure. In fact, stability and ruggedness are somewhat exclusive. A laboratory thermometer designed for maximum stability contains an unsupported element, which is far too fragile for industrial use. The elements of most industrial resistance thermometers are fully supported by a bobbin or packing material, and therefore stand up quite well to extreme environments. More likely to suffer are lead wire transition points, which should be properly immobilized. A typical RTD will meet a specification allowing shock of 100 G's of 8 milliseconds duration and vibration of 10 to 2000 Hz at 20 G's.

Packaging and Thermal Transfer

Sheaths and other structures surrounding resistive elements should maximize heat transfer from the sensed medium, minimize heat transfer from ambient which can alter readings, and provide necessary protection of the elements.

Proper materials and construction can dramatically improve reading accuracy. One strategy practicable only with wire-wound resistance thermometers versus thermistors, thermocouples, and solid-state devices are temperature averaging. An element may be wound to average temperature over lengths of up to 100feet.

2.10 Industrial RTD Probes

The encased probe is the standard resistance thermometer configuration for industrial process control and machinery protection. Most probe cases are stainless steel or Inconel to withstand high temperatures, although other materials offer advantages at intermediate ranges.

For example, the tip-sensitive probe of Figure a copper-alloy tip which conducts heat 20 times better than stainless steel. This design improves thermal contact with sensed surfaces and reduces errors from conduction along the sheath.

Standard probe diameters range from 0.125. to 0.250. Smaller probes respond faster when directly immersed, but larger probes may fit more snugly in standard thermowells. Probe lengths range from a few inches to ten feet or more.

Figure shows the construction of a high temperature probe. The element fits in the tip, surrounded by high temperature powder or cement. Extension leads, normally uninsulated, extend back from the element and are encapsulated by powder, cement, or bored ceramic spacers. External leads, often insulated with Teflon or glass braid, are potted with cement at the entry point to seal against moisture.

The alternative construction of figure places the element, potting, and lead transitions within a module at the tip of the probe. This design allows the user to cut the probe to required lengths. Temperature is limited to the rating of the external lead wire insulation: 260°C (500°F) for Teflon, up to 550°C (1022°F) for insulations such as woven mica/glass.

2.11 Probe Assemblies

A wide variety of mounting fittings and accessories aid probe installation. Selection depends on the nature of the medium being sensed and cost requirements. Direct immersion of a probe into a liquid requires a fitting with a pipe thread, which may be adjustable or welded on the probe. Figure shows a typical assembly, with one thread for mounting the probe and another for a connection head. Connection heads provide a transition between probe leads and external signal wires.

Mounting in a solid material is best accomplished with a spring-loaded holder, which may be fixed or adjustable. Spring loading provides good contact of the probe tip against the bottom of the hole and dampens potentially damaging vibration. When liquids are particularly corrosive, under high pressure, or fast-flowing, a thermowell may be necessary. A thermowell is a tube, closed at one end, which protects the probe and allows its removal without breaking the liquid seal. Many materials and styles are available to match application requirements. Thermowells drilled from solid bar stock provide the highest pressure ratings, but welded models cost much less.

2.12 Flexible Resistance Thermometers

The encased probes described above do not adapt well to sensing flat surfaces. Unlike thermocouple junctions, which can be welded directly to metal surfaces, resistance thermometers present a certain amount of bulk; and heat losses to ambient air may affect readings. Small flat elements, such as thin films, may mount on surfaces, but fragile element and lead wire connections make installation difficult.

Figure shows a flexible resistance thermometer with a wire-wound sensing element sandwiched between insulating layers. It conforms closely to sensed surfaces, and has thin insulation to readily transmit heat to the sensing element. The wire element may be wound to nearly any size to average out temperature gradients, and the flexible construction can withstand extreme shock and vibration.

2.13 Special Purpose Resistance Thermometers

Resistance thermometers readily adapt to most process control and thermal equipment designs. The user may specify cases with axial leads for circuit board mounting, flat packages for clamping to surfaces, miniature cases for embedment into metal blocks, and any sheaths and fittings which can be produced by a machine shop. In addition, wire windings may be configured to sense over large areas.

Flexible resistance thermometer

2.14 Where to use resistance thermometers

In summary, resistance thermometers offer the greatest benefits relative to other thermometer types in these situations:

- ✓ Accuracy and stability are the foremost goals of the Application.
- ✓ Accuracy must extend over a wide temperature range
- ✓ Area, rather than point, sensing improves control
- ✓ A high degree of standardization is desirable

2.15 Advantages and limitations

Advantages of platinum resistance thermometers

- ✓ High accuracy
- ✓ Low drift
- ✓ Wide operating range
- ✓ Suitable for precision applications

Limitations

- ✓ RTDs in industrial applications are rarely used above 660 °C. At temperatures above 660 °C it becomes increasingly difficult to prevent the platinum from becoming contaminated by impurities from the metal sheath of the thermometer. This is why laboratory standard thermometers replace the metal sheath with a glass construction. At very low temperatures, say below -270 °C (or 3 K), due to the fact that there are very few photons, the resistance of an RTD is mainly determined by impurities and boundary scattering and thus basically independent of temperature. As a result, the sensitivity of the RTD is essentially zero and therefore not useful.
- ✓ Compared to thermistors, platinum RTDs are less sensitive to small temperature changes and have a slower response time. However, thermistors have a smaller temperature range and stability.

Sheath Materials, Thermowell, Fittings and terminations

3.1 Sheath Materials

Sheath material ranges from mild and stainless steel to refractory oxides (Ceramics) and a variety of exotic material including rare metals. Sensor inserts are fabricated unit which is comprised by a sensor and a terminal base; the sensor is housed in a stainless steel insert tube, usually of 6 or 8mm diameter and, then it is inserted into the actual protection tube. Good sheathing with physical contact between the insert tip and sheath end is essential to ensure good heat transfer. Spring contact is used in the terminal base to maintain this contact. This arrangement facilitates easy replacement of the sensor whenever required. In the case of a mineral insulated thermocouple or Pt100, the sensor is designed as an integral part with the insert tube.

3.1.1 Metallic or Non-Metallic Sheathing

Metallic tube, most commonly stainless steel, has mechanical advantage and higher thermal conductivity; they are generally immune to thermal shock. Metallic sheath can be used at temperature up to 1150°C. Ceramics are superior when high purity is required to avoid sensor or product being contaminated at elevated temperature.

3.1.2 Ceramic Sheath with Thermocouple Element

Ceramic sheath's main application ranges between 1000 to 1800 °C. They may be in direct contact with the medium or may be used as a gas-tight inner sheath to separate the thermocouple from the actual metal protection tube. They should be mounted in hanging position above 1200°C to prevent distortion or fracture due to bending stresses. Even hairline cracks can lead to contamination of the thermocouple resulting in drift or failure. The wall thickness of the material is also important; thin walled tube is preferable to larger wall thickness. Cracks frequently developed if they are given excessively rapid temperature changes when they are quickly removed from hot furnace.

Protection Tubes

Caution: Due to high thermal conductivity of the metal tubes, minimum insertion length should be more than twenty five times of its overall diameter to eliminate heat conduction error.

(A) Metallic Protection Tubes

Sr. No.	Material	Max./Operating Temperature (°C)	Feature
1	304 S.S.	980°C	Widely used as a common protection tube against heat and corrosion but not recommended for use in the presence of sulphur or reducing flame. Subject to stress and "pit" corrosion.
2	321 S.S.	980°C	Higher corrosion resistance than 304 S.S. because of its Ti content to prevent carbon precipitation. Excellent resistance to grain boundary corrosion after welding due to less carbon precipitation.
3	316 S.S.	980°C	Contains Mo and has excellent resistance to corrosives, heat, acids and alkalis.
4	316L S.S.	980°C	Less carbon content than 316 s.s. an has better resistance to grain boundary corrosion, Resistant to "pit" corrosion.
5	310 S.S.	1,000°C	High Ni-Cr content and good high temperature strength with resistance to oxidation at high temperature high mechanical strength
6	446 S.S.	1,050°C	Excellent resistance to oxidizing and reducing flames containing sulphur. Suitable for use in non-ferrous molten metals and other high temperature application, but less mechanical strength.
7	Inconel 800	1000°C	Excellent to high temperature oxidizing atmosphere and thermal shock. Above 10 times longer service life than 304 S.S. against high temperature corrosion.

Sr. No.	Material	Max./Operating Temperature (°C)	Feature
8	Inconel 825	1000°C	An improved version of inconel 800. All round superior alloy for high temperature applications, particularly in oil refineries against organic sulfides, hydrogen sulfide and sulphur combustion products.
9	Inconel 600	1,050°C	Excellent resistance to oxidizing and reducing atmospheres at high temperature. But sulphurous atmospheres should be avoided. Immune to stress and "pit" corrosion.
10	Inconel 601	1,050°C	superior oxidation resistance at high temperature to inconel 600, by virtue of strong bonding of metal oxide film.
11	Inconel 625	1,050°C	Improved strength and stress rupture properties up to 980°C by MO and CB additional and immune to chloride stress corrosion cracking.
12	253 MA	1000°C	Superior Oxidation resistance to 310SS at high temperature due to formation of dense and tight oxide layer by silicon and cerium additions. can be used in the sulphurous atmospheres.
13	UMCO	Oxi. 1150°C Red. 1200°C	Excellent resistance to heat, corrosion and abrasion. One of the best alloy against high temperature sulphur bearing atmospheres.
14	Kanthal A1	1100°C	Good resistance to high temperature oxidation but becomes brittle due to recrystallization. Poor mechanical strength above 850°C.
15	Hastelloy B	Oxi. 500°C Red. 760°C	Excellent resistance to heat in corrosion, especially to HCl and H ₂ SO ₄ .
16	Hastelloy C-276	1000°C	Excellent resistance to high temperature oxidizing and reducing atmospheres and also Cl ₂ gases.
17	Hastelloy X	1100°C	Excellent resistance to oxidizing and carburizing atmospheres at high temperatures. Better machinability and weldability than other Hastelloy alloys.
18	Monel	Oxi. 500°C Red. 600°C	Excellent resistance to water vapor and sea water at high temperature and corrosion.
19	Platinum	1,650°C	The platinum group metals are well suited for use at extremely high temperature under mechanical loads and simultaneous corrosive attack. They have high melting points, excellent chemical stability and are highly resistant to oxidation.
20	Titanium	Oxi. 250 Red. 1000°C	Superior corrosion resistance in cryogenic temperature but at high temperatures easily oxidized and becomes brittle.
21	Tantalum	Oxi. 300 Red. 2,200°C	Excellent heat-resistant material with high resistance to all acids but apt to severe oxidation and embitterment in air at high temperature. Tantalum is outranked by tungsten for high temperature strength.
22	Molybdenum	Oxi. 400 Red. 2,000°C	Excellent mechanical strength up to 1500°C for applications under inert, reducing and vacuum atmosphere. Resistance to metal vapours at high temperature but react with carbon or graphite. Should not be used in air or oxygen containing gases.

(B) Non-Metallic Protection Tubes

Sr. No.	Material	Max./Operating Temperature (°C)	Feature
1	refractory oxide recrystallised Al_2O_3 -99.7% (710)	1750°C - max.	Good choice for rare metal thermocouple. Good resistance to chemical attack. Mechanically strong but severe thermal shock should be avoided.
2	Silicon carbide	1500°C - max.	Good level of protection even in severe conditions. Good resistance to reasonable level of thermal shock. Mechanically strong when thick wall is specified but become brittle when aged. Unsuitable for oxidizing atmosphere but resists fluxes.
3	Silicon Nitride (Si_3N_4)	1,350°C	Excellent thermal shock resistance. Less corrosion to acids and alkalis. High hardness. Fairly good resistance against most of molten metals.
4	Cermet (Chrome-Alumina)	1,300°C	77% Alumina -23% Chrome Excellent resistance to heat and abrasion. Recommended for temperature measurement of molten copper and other nonferrous metals.
5	Quartz	1,000°C	Excellence to thermal shock but fragile. Poor resistance to alkalis but good to acids. Less gas-tightness in hydrogen and reducing gases. High thermal conductivity.
6	60% Alumina	1,500°C	60% alumina-40% Silica Sintered alumina. Better than Pt2 but slightly less thermal shock resistance. recommended for use in heating furnace and regenerator, impervious.
7	Self Bonded Silicon Carbide	1,650°C	99% SiC. Very low porosity. Excellent resistance to thermal shock, corrosion and abrasion at high temperatures. recommended for use in oxidizing and reducing atmosphere upto 1650°C but attacked by water vapor.
8	Nitride Bonded Silicon Carbide	1,550°C	78%SiC+3%SiO ₂ +18%Si ₃ N ₄ (Si ₂ ON ₂) Excellent performance superior to Y3 SiC but contains Si ₃ N ₄ . Most suitable for use in molten aluminium, against most of molten metals.
9	Tungsten Carbide	1,600°C	Good mechanical strength and high abrasion resistance.

Note: Operating and maximum temperatures of the above tubes vary depending on the measuring environments.

3.1.3 Insulation material

Mostly used insulation materials are given below:

Sr. No.	Insulation Material	Max./Operating Temperature (°C)	Feature
1	Alumina Al_2O_3	1,900°C	High-purity aluminum oxide is the standard insulation material. Alumina offers high thermal conductivity and high electrical resistivity.
2	Hafnia (HfO_2)	2,400°C	Refined high-purity hafnia offers a good electrical resistivity at elevated temperatures. Hafnia's resistivity is comparable to that of beryllium oxide, but hafnia does not present the potential health problems associated with beryllium oxide. Hafnia is therefore replacing beryllium oxide in many applications.
3	Beryllium Oxide (BeO)	2,315°C	It has High electrical resistivity, toxic dust. But Beryllium Oxide needs special handling.
4	Magnesium Oxide (MgO)	1,370°C	Used primarily with compacted sheathed thermocouples,
5	Alumina 610	1,200°C	Good Insulation Properties.

3.2 Thermowell

Thermowells provide protection for temperature probes against unfavorable operating conditions such as corrosive media, physical impact (e.g. clinker in furnaces) and high pressure gas or liquid. Their use also permits quick and easy probe interchanging without the need to “open-up” the process.

It is closed-end reentrant tube designed for insertion of a temperature-sensing element, and provided with means for a pressure-tight attachment to a vessel.

Thermowells are typically constructed of solid drilled-out bar stock and are designed to protect a temperature sensor from flow, high pressure and harsh environments. Thermowells encase and protect temperature sensors from the harmful effects of the processes into which they are immersed without substantially insulating the temperature sensor (thermocouple, RTD, etc.) from the temperature of the process.

Thermowells are hidden in pipes and are rarely seen. Thermowells are permanently placed into pipes, tanks or sumps so that temperature measurement probes can be inserted into the pipe to measure the contents temperature.

3.2.1 MOST COMMON TYPES OF THERMOWELLS

3.2.1(a) According to their connection to process

The most common types of thermowells are

- (1) Threaded
- (2) Socket Weld
- (3) Flanged Welded

Thermowells are classified according to their connection to a process.

(I) Threaded Thermowell

A threaded Thermowell has threads at its one end and is screwed into the process. Thread can be of tapered or parallel type. Parallel or tapered thread is made for convenient installation into a weld in fitting directly into the process. Such a connection is suitable for smaller diameter well, which are not likely to be changed.

(II) Socket Weld Thermowell

A socket weld Thermowell is welded into a weldolet and a weld in Thermowell is welded directly into the process. Welded connection can be used when the process is not corrosive and routine removal is not required. High integrity is achieved and this technique is suitable for high temperature and pressure.

(III) Flanged Thermowell

A flanged Thermowell has a flange collar which is attached to a mating flange. Flanged connection is preferable if there is a need for more frequent well replacement such as high corrosion rates.

3.2.1(b) According to their production method

Thermowells are also classified according to their production method.

- (I) Fabricated Thermowell
- (II) Bar-stock thermowell
- (III) Van-stone thermowell

(I) Fabricated Thermowell

Fabricated thermowells are manufactured from tubes which are sealed by a solid welded tip at the process. It means that the stem of thermowell is manufactured from tube and tip is made separately than both these parts are welded by utilizing suitable welding process. The flange is also joined to this assembly by welding process. Fabricated thermowells are generally recommended for low to medium process loads. Connection to the pipe or vessel may be done by means of thread, flange or weld. Standard threads used in fabricated thermowell are NPT, BSP (PI), BSP (Tr), API & metric thread. The thread size is dependent on the application. Standard sizes range from 1/8" to 2". For applications where a quick response to changes in temperature is required, fabricated pockets may be fitted with a reduced tip.

(II) Bar stock Thermowell

Such thermowell bodies are machined and drilled from solid bar stock. This results in a non-welded water tight unit. In this Immersion tip is also made by same material along with stem. In such type of thermowell, no welding process is required for stem and tip production. Flange can be weld according to requirement. Bar-Stock thermowell is also known as "Solid drilled thermowell". Single piece thermowells are manufactured from a complete element or bar stock. One-piece thermowells are suited to the highest process loads, depending on their design. Thus internationally or in the petrochemical industry, one-piece thermocouples are now used almost exclusively. Connection to the pipe or vessel may be done by means of thread, flange or weld. Standard threads are NPT, BSP (P), BSP (Tr), API & metric thread. The thread size is dependent on the application, but 3/4" and 1" are common.

(III) Van-Stone Thermowell

In van stone thermowell, stem, tip and sub part of flange all these three prepared by using single bar or rod material. There is no need of welding for these three parts of thermowell. The flange sub-part serves as a gasket in such type of thermowell. On this sub-part flange is used according to requirement.

3.2.2 Thermowell Tip Profile

Tapered

The outside diameter decreases gradually along the immersion length. Used for high velocity applications.

Flat Tip

It one end has flat surface. Used in low pressure applications or where flow characteristics around the thermowell are not important.

Domed Tip

Such thermowell has semi-spherical tip at one end of thermowell. Used in higher pressure applications or where flow characteristics around the thermowell are important. This ensures a high degree of mechanical strength without losing the sensitivity or accuracy of the indicator.

Spherical Tip:

For spherical tip, special drill is used with a tip angle of 118°C for production of thermowell. To achieve a possible uniform wall thickness, the tip is ball shaped or spherical in shape. Used in higher pressure applications or where flow characteristics around the thermowell are important. This ensures a high degree of mechanical strength without losing the sensitivity or accuracy of the indicator.

3.2.3 Basic Construction of Thermowell

Shank Construction

(I) **Q Dimension** The thickest part of the shank of the well on the hot side of the process connection or flange. It is dependent on the bore size and the process connection size.

(II) **Bore Size** The inside diameter of thermowell. In other words, the diameter of the internal cylindrical cavity of a thermowell or protection tube. Standard bore sizes are 6.5 mm, 8.5 mm.

(III) **Immersion ("U") Length** The length of a thermowell or protection tube below the mounting threads, flange, bushing, etc. extending into the process area. The "U" length is measured from the bottom of the process connection to the tip of the thermowell.

(IV) **Lagging Extension ("T") Length** The length of a thermowell, in addition to the standard head lengths, required to make the head of the thermowell accessible and this enable the probe to extend through insulation or walls.

(V) **Internal Mounting Thread** The thread within the thermowell for attaching a temperature device of the union and nipple extension for a thermowell assembly.

3.2.4 Types of Flange Face

(a) Raised Face (RF)

The Raised Face type is the most applied flange type, and is easily to identify. It is referred to as a raised face because the gasket surfaces are raised above the bolting circle face.

(b) Ring-Type Joint (RTJ)

RTJ flanges have grooves cut into their faces which steel ring gaskets. The flanges seal when tightened bolts compress the gasket between the flanges into the grooves, deforming (or Coining) the gasket to make intimate contact inside the grooves, creating a metal to metal seal.

An RTJ flange may have a raised face with a ring groove machined into it. This raised face does not serve as any part of the sealing means. For RTJ flanges that seal with ring gaskets, the raised faces of the connected and tightened flanges may contact each other. In this case the compressed gasket will not bear additional load beyond the bolt tension, vibration and movement cannot further crush the gasket and lessen the connecting tension.

Ring Type Joint gaskets* are metallic sealing rings, suitable for high-pressure and high-temperature applications. They are always applied to special, accompanying flanges which ensure good, reliable sealing with the correct choice of profiles and material. Ring Type Joint gaskets are designed to seal by "initial line contact" or wedging action between the mating flange and the gasket. By applying pressure on the seal interface through bolt force, the "softer" metal of the gasket flows into the micro fine structure of the harder flange material, and creating a very tight and efficient seal.

*** Note: Gasket is a mechanical seal which fills the space between two or more mating surfaces, generally to prevent leakage from or into the joined objects under compression.**

(c) Flat Face (FF)

The flat face (full face) flange has a gasket surface in the same plane as the bolting circle face. Applications using flat face flanges are frequently those in which the mating flange or flanged fitting is made from a casting. Flat face flanges are never to be bolted to a raised face flange.

3.2.5 Welding on Thermowells

Welding is a process of joining two metals by heating the metals to a suitable temperature. It may be done with or without the application of pressure, and with or without filler.

Types

Full Penetration Welding - This type of welding ensures a fully welded interface between the two parts and is generally the strongest joint.

Partial Penetration Welding - This type consists of a partially welded interface with filler metal being laid on the surface of the two metals.

3.2.6 Welding Procedure Specification (WPS) & Procedure Qualification Record (PQR)

A WPS is a document that describes how welding is to be carried out in production. They are recommended for all welding operations and many application codes and standards make them mandatory.

The purpose of the document is to guide welders to the accepted procedures so that repeatable and trusted welding techniques are used. A WPS is developed for each material alloy and for each welding type used.

A WPS is supported by a Procedure Qualification Record (PQR or WPQR). A PQR is a record of a test weld performed and tested (more rigorously) to ensure that the procedure will produce a good weld.

The variables required to be documented are typically such items as:

- welding process used, size, type and classification of filler alloy.
- type and thickness of base material welded.
- type and polarity of welding current, amps and volts recorded.
- travel speed during welding, welding position, type and dimensions of joint design.
- preheating temperature, interpass temperature, post weld heat treatment details, and others.
- In addition to the recording of all the welding variables used during the test, in order to qualify a welding procedure, details of the inspection and test results must also be recorded. These records must show that the inspection and testing has proven that the weld samples have met or exceeded the specified standard requirement.

3.2.7 Thermowell Special Coating

Different types of coating are carried out in thermowells. Some are as follows: Metal Thermowells with Tungsten Carbide / Ceramic / PTFE / PVDF / PFA Coatings.

Sr. No.	Coating	Thickness	Operating Temperature (°C)	Features
1	Tungsten Carbide Coated	0.5-1.0mm	Below 650°C	Tungsten carbide coating offers effective wear resistance coating, as it offers exceptionally high hardness level (maximum 74 HRC hardness). It is resistance to high temperature and corrosion & high abrasive condition.
2	Teflon Coated	0.5-1.0mm	200°C	Teflon coating provides a dry film lubricant which provides excellent resistance against corrosion and chemicals.
3	Boron Nitride Coated	0.5mm	900°C	Boron nitride protects surface which comes in contact with molten metal (specially aluminum). Boron nitride inhibits corrosion and chemical attacks, and provide easier release and longer life.
4	Zirconia Coated	0.5-0.1mm	1800°C	Zirconia coating produces a hard and chemically resistant protective layer suitable for high temperature and corrosion.
5	Alumina Coating	0.5-1.0mm	1200°C	Alumina coating provides a high temperature abrasive protection.
6	Stellite Coating	0.5-1.0mm	1200°C	Stellite coating provides very good abrasion resistance and good chemical corrosion resistance.

3.2.8 Test on Thermowell:

1 Material Test

Chemical- By PMI (Positive Material Identification).

Physical -By Tensile, Elongation, Hardness, Micro & Macro examination, IGC tests.

2 Dimensional Test

The Thermowell must be checked according to specified dimension given in drawing.

3 Hydrostatic Pressure Test

A hydrostatic pressure test is a way in which leaks can be found in pressure vessels such as pipelines and plumbing. The test involves placing water, which is often dyed for visibility, in the thermowell at the required pressure to ensure that it will not leak or be damaged. It is the most common method employed for testing pipes and vessels. Using this test helps maintain safety standards and durability of a vessel over time. Newly manufactured pieces are initially qualified using the hydrostatic test.

4 Dye Penetrant Inspection

Dye penetrant inspection (DPI), also called liquid penetrant inspection (LPI) or penetrant testing (PT), is a widely applied and low-cost inspection method used to locate surface-breaking defects in all non-porous materials (metals, plastics, or ceramics). LPI is used to detect casting, forging and welding surface defects such as hairline cracks, surface porosity, leaks in new products, and fatigue cracks on in-service components.

5 Radiography

Radiographic Testing (RT), or industrial radiography, is a nondestructive testing (NDT) method of inspecting materials

for hidden flaws by using the ability of short wavelength electromagnetic radiation (high energy photons) to penetrate various materials. Irregularities and flaws that can be detected with include - cracks, voids, thickness, lack of fusion, lack of penetration, porosity and misalignment.

3.2.9 Selection of Thermowell

Materials the Longevity Factor

The selection of material is the most important factor for thermowell life. The material selected is based on the temperature of the application and the process medium.

1. Connection-The Installation Factor

All threaded wells are made by easily welded or brazed materials. Welding and brazing is important for the installation requiring seal. The pipe thread provides mechanical strength, and the weld or braze provides the seal.

Flanged wells (other than van stone type) consist of a bar stock well which is solidly welded to a top quality flange. Standard construction uses a primary "J" groove weld and a bevel groove clean fillet. This double welded construction eliminates the possibility of crevice corrosion since no open joint are exposed from either inside or outside the installation. Socket weld wells are simple to install, simply weld them into place.

2. Insertion Length-The Accuracy Factor

The distance from the tip of the well to the underside of the thread or other connection is defined as the insertion length (designated as "U"). For best accuracy this length should be greater enough to permit the entire temperature sensitive part of element to project into the medium being measured. A properly installed element: in liquid, the element should be immersed up to its sensitive length plus one inch, and in air or gas, the element should be immersed up to its sensitive length plus three inches.

3. Bore Size-The Interchangeability Factor

Almost all installation uses several type of temperature measuring sensor. The selection of a standard bore diameter can produce extreme flexibility within the plant. The same well can accommodate thermocouple, resistance thermometer, and bimetal thermometer.

4. Tapered or Straight Well- the Velocity Rating Factor

Tapered shank provides greater stiffness with same sensitivity. The higher strength to weight ratio give these wells higher natural frequency than the equivalent length straight shank well thus permitting operation at higher fluid velocity.

The American Society of Mechanical Engineers (ASME) Performance Test Codes (PTC) is used to determine the performance of specific, mechanical equipment, which are designed to meet specified criteria for performance and operability. The results from applying Codes indicate how well the equipment performs its intended function.

The ASME PTC 19.3 is a thermowell stress calculation, which serves as a mathematical proof that the material chosen and the mechanical design will not fail given the effects of the operating conditions. The calculation provides guidance for establishing a comparison between the shedding frequency and the natural frequency of the thermowell.

3.2.10 PTC 19.3-2010 Standard for Thermocouple

In 1999, it was discovered that thermowells designed to PTC 19.3-1974 in no steam services suffer catastrophic failure. Due to this problem, the committee decided to rewrite the entire standard. The 2010 version includes an evaluation of the forces caused by external pressure and the combination of static and dynamic forces.

ASME PTC 19.3 TW-2010 standards main criteria's for thermowell are as follows:

a.) Criteria for Thermowells

The ASME PTC 19.3 TW-2010 standard applies to thermowells that are:

1. Machined from bar stock.
2. Straight, tapered or step-down shank.
3. Threaded, flanged, van stone or welded process connection.
4. Surface finish of 32 μ in. Ra or better.

b.) Not within the Scope of This Standard

1. Thermowells manufactured from pipe.
2. Specially designed surface structures, e.g. knurled, spiral.
3. Thermowells fabricated in piece construction (welding of the shank in sections).
4. Shanks that include flame spray or weld overlays.
5. Use of ball joints, spherical unions or packing glands.
6. Ceramic wells or any non-metallic or exotic metals.

c.) Selection of Thermowell Materials

The selection of thermowell material is usually governed by corrosion resistance, strength requirements, temperature limits and welding compatibility to the process piping in the case of socket and weld-in thermowells.

Materials should be certified to meet the requirements of recognized codes (ASTM, ANSI or ASME). Other materials may be used, providing they conform to published specifications covering chemical, physical and mechanical properties as required by this standard.

d.) Low Fluid Velocities

At low velocities, the risk of thermowell failure is minimal and does not usually require frequency calculations.

If the following criteria are met, the designer may elect to waive calculation requirements.

1. Maximum fluid velocity is less than 2.1 ft/sec. [0.46 M/s].
2. Wall thickness at "A" support diameter minus "b" bore diameter ≥ 0.376 " [9.55 mm].
3. "L" Unsupported length ≥ 24 " [61 M]
4. "A" support and "B" tip diameter ≥ 0.5 " [12.7 mm]
5. Thermowell material satisfies "S" maximum allowable working stress ≥ 69 Mpa.
6. "Sf" fatigue endurance limit, in the high-cycle limit ≥ 21 Mpa.
7. Thermowell material not subject to stress corrosion or embrittlement.

e.) Frequency Limits

ASME PTC 19.3 TW-2010 has revised the frequency criteria based on limits set by in-line resonance and passage of static cyclic conditions.

In low density gases with a Scruton Number (N_{sc}) of >2.5 Reynolds Number <105 , the in-line resonance is suppressed and therefore the acceptable ratio will be:

$$f_s < 0.8 f_{nc}$$

If a thermowell passes cyclic stress conditions for operation at the in-line resonance condition, the acceptable ratio will be:

$$f_s < 0.8 f_{nc}$$

If a thermowell fails the cyclic stress condition for operation at the in-line resonance condition, the thermowell natural frequency will be high enough to limit excitation of the in-line resonance. Therefore, the acceptable ratio will be:

$$f_s < 0.8 f_{nc}$$

f.) Process Information Required to Run the ASME PTC 19.3-TW-2010 Calculation

This Software is free downloadable from our website link "http://tempsens.com/thermowell_calculator.html"

Minimum mandatory information required

1. Maximum or operating temperature.
2. Maximum or operating pressure.
3. Fluid (gas or liquid) velocity.
4. Fluid density.

Additional Information if available (recommended)

1. Process Fluid (air, steam, water, etc.).
2. Pipe size and schedule.
3. Fluid flow rate.
4. Fluid viscosity (will use 0.0171 centipoises if not known).
5. Shielded length (flanged Thermowell). if information is available, their will improves stress resistance.

3.3. Thermowell Fitting Accessories

Installing temperature sensor assemblies into thermowell or directly into the process requires the use of some kind of brass or stainless steel fitting.

Fitting include various threaded unions, bayonet cap (and adapters) and flange.

Adjustable flange can similarly be used to sensor assembly into the process.

Bayonet caps provide a method of quick fitting into suitable adapters located in the process; this technique is widely used in plastics machinery.

Bushes and hexagon plugs are used when adjustment or removal is a lesser consideration.

The choice of fitting may be dictated by the need for pressure integrity or by physical size constraints. Compression fitting and threaded bushes can be supplied with tapered threads to achieve a pressure-tight connection.

a.) Compression Fitting

Adjustable compression fitting are used directly on probe to achieve the required insertion length in the process and to ensure the proper sheathing of probes into thermowell.

Compression fittings for attaching tubing (piping) commonly have ferrules in them. Compression fittings are popular because they do not require soldering, so they are comparatively quick and easy to use.

b.) Nipple Fittings

Nipples are made up with a flange from the same family on each end of a tube section. (Fittings that are manufactured with different flange families on each end are called hybrid adapters.) Straight nipples are manufactured with the same size flange on each end of straight section of tubing. Reducer nipples have different size flanges (from the same family) on each end.

The three piece unions have to be used in hazardous areas, for the junction between conduits pipes and boxes or various appliances. The unions are made up of three independent pieces that can be screwed up by rotating the same pieces among them.

3.4. Terminations

Metallic Plugs and Socket Connections

The link between the thermoelectric wires of the thermocouple and those of the extension cable is made by means of non - compensated male and female connectors. The metallic body and casing of these connectors ensure the screening continuity as well as good temperature

Standard & Miniature Thermocouple Connectors

Standard & Miniature connectors are ideal for connecting thermocouple sensors and extension or compensating cable to each other. The pins are polarized to avoid an incorrect connection and the connector body is additionally marked for polarity. These connectors have color coding according to special standard like: ANSI, IEC etc.

Temperature Calibration Equipment

D

INSPECTION, TESTING AND CALIBRATION

4.1 Inspection and Testing

For the assurance of the quality of Sensor different type of testing is done they are:

(i) Type Test & (ii) Routine Test.

(i) Type Tests

The tests which are carried out to prove conformity with the requirements of the specification are called type test. These are intended to prove the general qualities and design of a given sample of sensor.

(ii) Routine Tests

The tests which are carried out on each sensor as per sampling plan are called routine test.

The major tests for the assurance of the quality are as follows:

(a) Appearance and Structure Check

Visual inspection is made to confirm that the thermocouple assembly is in conformity with the specification, drawing and constituent materials. Visual checking is conducted on the finish of joints, junctions, welds, name/tag plates and other parts to confirm that there is no error, flaw, dirt or irregularity on the surface finish. If necessary, dye penetration check, hydrostatic pressure test and X-ray inspection can be made on welded and joint parts.

(b) Dimensional Check

Unless otherwise specified, dimensional check is made in accordance with the following tables using Vernier Caliper, Straight Measure and Gauges.

Non MI Unit, mm		Non MI Unit, mm	
Nominal Length	Tolerance	Nominal Length	Tolerance
Below 1,000	±3.0	Below 250	±3.0
1,000 - 2,000	±5.0	250 - 1,000	±5.0
Over 2,000	±7.0	Over 1,000	±1.0%

(c) Insulation Resistance Test

Insulation Resistance Test is conducted using a Super megohmmeter applying steep temperature gradient on sensor assembly immersed in a boiling water bath so as to accelerate condensation of moisture that might be entrapped in the assembly. This enables the measurement of insulation resistance of the assembly very precisely between terminal and sheath.

Sensor	Voltage	Insulation Resistance
Non MI	at room Temperature DC 500V	More Than 100MΩ
MI Dia - 2.0 and Below	at room Temperature DC 1000V	More Than 100MΩ
MI Dia - 3.0 and Above	at room Temperature DC 500V	More Than 100MΩ
RTD	at room Temperature DC 250V	More Than 100MΩ
T/C	at 560°C DC 500 V	More Than 5MΩ

(d) emf Calibration Test

These tests can be made either by comparison method with standard thermocouples /RTD or absolute method using fixed point standards on every unit or batch at the pre-set three temperature points depending on the types of sensor.

(e) Pressure Test (For Sealed Elements Only)

The element shall be tested in a hydraulic test chamber containing water and ice in equilibrium and connected electrically to an appropriate indicator. The pressure of the fluid in the chamber shall be raised to 35kgf/cm and shall be maintained for 15 minutes.

The resistance or EMF of the element shall not vary significantly from that appropriate to the equilibrium temperature corresponding to the pressure applied and when subsequently removed from the chamber, the element shall pass insulation resistance test and accuracy test.

(f) Identification Test on the Thermocouple Type and Polarity

Either by dipping thermocouple assembly into the above boiling water bath or applying hot air-blow/flame heat on the beaded Thermocouple at its hot or cold end to have it generate EMF, which allows to indicate specific type of thermocouple through Temperature vs. EMF Table. A high resolution D.C. circuit testing instrument is used to identify the type of thermocouple and polarity of the thermocouple leg and terminal.

(g) Others

Loop Resistance test, voltage withstand test, X-ray test, vibration test, pressure test, Helium leak test, etc. can also be conducted upon request.

4.2 Calibration

Temperature is one of the most frequently measured parameters in industrial processes. Wide varieties of mechanical and electrical thermometers are used to sense and control process temperatures. Regular calibration of these thermometers is critical to ensuring consistent quality of product manufactured, as well as providing regulatory compliance for some industries.

Calibration is a comparison between measurements - one of known magnitude or correctness made or set with one device and another measurement made in as similar a way as possible with a second device.

The device with the known or assigned correctness is called the standard. The second device is the unit under test, test instrument, or any of several other names for the device being calibrated.

Calibration is performed to verify sensor/instrument performance. Calibration is the process used to ensure that a sensor/instrument maintains specification over time and changing ambient conditions. Calibration is the process used to maintain traceability of parameters with reference to national/international standards.

There are many definitions of calibrations as there are methods: According to ISA's The Automation, Instruments and Systems dictionary, The word calibration is defined as "A test during which a known value of measurand are applied to transducers and corresponding output readings are recorded under specified conditions ". The definition includes the capability to adjust the instrument at zero and to set the desired span. An interpretation of definition would say that the calibration is a comparison of measuring instrument against a standard instrument of higher accuracy to detect, correlate, adjust, rectify and document the accuracy of the instrument being compared.

4.2.1 Types of Thermal Calibration

There are mainly two types of calibrations method used they are, Fixed point method and comparison method.

a.) Fixed Points

Fixed points are the most accurate devices available for defining a temperature scale. Fixed point devices utilize totally pure materials enclosed in a sealed, inert environment; they are usually fragile and need to be handled with care.

The housing incorporate isothermal blocks with wells into which the probes are placed. Since fixed point temperatures are defined by physical laws, comparison of the test probe to a reference probe is not required.

Fixed point calibrations are used for primary temperature standards to achieve the lowest possible uncertainties. It is a time consuming method and requires the use of expensive fixed point cells.

The triple point of water (TPW) cell may be the most commonly used type of fixed point and is used in ITS 90 calibrations. Water can exist as a solid, liquid, and vapor at 0.01°C and this device creates this temperature.

Figure 1. Triple point of water cell

Fixed points method

This absolute method is used for the realization of the International temperature scale, ITS-90. The thermometer is calibrated by measurements at a series of temperature fixed points: e.g. freezing/melting points, triple points, vapour pressure points.

This method consists in setting up a thermometer in a fixed-point cell that provides an isothermal environment.

The fixed point cell is a flask almost completely filled with pure material and protected by a shell. The cell is placed in an apparatus that must provide good temperature control and sufficient cell immersion to generate a uniform temperature in the measurement zone. The apparatus must provide for fixed-point cooling as well as controlled heat. It may be a furnace - generally, a vertical tube furnace with suitable insulation - or a liquid bath.

A number of fixed points are chosen. They should be as few as possible, consistent with the need to establish a good interpolating formula. This method gives a highly accurate calibration and is used only for highest quality thermometry. But it is difficult to undertake because of the complexity of the equipment and the many precautions that must be taken to realize the fixed points successfully.

Fixed points are realized using numerous pure substances. However, many do not ensure the required stability and reproducibility and others require a complex procedure and special laboratory facilities.

ITS 90 fixed points include:

Boiling point of Nitrogen	-195.798°C
Mercury triple point	38.8344°C
Triple point of water	0.01°C
Melting point of Gallium	29.7646°C
Freezing point of Indium	156.5985°C
Freezing point of Tin	231.928°C
Freezing point of Lead	327.462°C
Freezing point of Zinc	419.527°C
Freezing point of Antimony	630.63°C
Freezing point of Aluminum	660.323°C
Freezing point of Silver	961.78°C

b.) Comparison method

In the comparison method we need :

- Stable temperature source
- Calibrated master sensor
- Calibrated meter

The calibration environment to choose depends on the temperature range, as follows:

- For low temperature calibration (typically below -180°C) a vacuum-jacketed copper block.
- Above -90°C and up to 300°C a controlled stirred liquid bath is the most common means of calibration. Freon or alcohol may be used from -90°C, water at room temperature, oil to 300°C.
- For temperatures up to 600°C a salt bath/fluidized bath/dry block may be used.
- For higher temperatures furnaces are more appropriate. Many designs exist. Some have low thermal mass and rapid response; others have large thermal mass and slow response.

To minimize or reduce temperature gradients within a bath or furnace, a metal equalizing block is inserted, with thermo wells to receive both the standard and the thermometer(s) to be calibrated. This method allows a wide range of temperatures to be covered, point by point or continuously, in a short time, and to calibrate simultaneously a great number of thermometers. Nevertheless, the comparison method is less accurate than the fixed point method because of the lesser accuracy and stability of the reference standard and enclosure.

Comparison calibrations can be performed in a laboratory or in the field. High accuracy can be obtained with careful selection of equipment. Durability is an important as accuracy when used for field calibrations. Equipment that cannot stand up to field use will drift quickly and not provide the expected measurement uncertainties.

Cold junction Compensation (CJC)

To make accurate measurements for thermocouples, this must be compensated for by using a technique known as cold junction compensation (CJC). As the law of intermediate metals states that a third metal, inserted between the two dissimilar metals of a thermocouple junction will have no effect provided that the two junctions are at the same temperature. This law is also important in the construction of thermocouple junctions. It is acceptable to make a thermocouple junction by soldering the two metals together as the solder will not affect the reading. In practice, thermocouple junctions are made by welding the two metals together (usually by capacitive discharge). This ensures that the performance is not limited by the melting point of solder.

All standard thermocouple tables allow for this second thermocouple junction by assuming that it is kept at exactly zero degrees centigrade. Traditionally this was done with a carefully constructed ice bath (hence the term 'cold' junction compensation). Maintaining an ice bath (at 0 °C) is not practical for most measurement applications, so instead the actual temperature at the point of connection of the thermocouple wires to the measuring instrument is recorded.

Typically cold junction temperature is sensed by a precision thermometer in good thermal contact with the input connectors of the measuring instrument. This second temperature reading, along with the reading from the thermocouple itself is used by the measuring instrument to calculate the true temperature at the thermocouple tip. Understanding of cold junction compensation is important; any error in the measurement of cold junction temperature will lead to the same error in the measured temperature from the thermocouple tip.

c.) Electrical Calibration - Simulators and Sources

Indicators and controllers are calibrated by injection signals which simulate thermocouples, resistance thermometers or thermistors. A simulator provides a very quick and convenient method for calibrating an instrument at many points. Very sophisticated and highly accurate laboratory instruments are available to permit on-site checking and calibration with a good level of accuracy.

4.2.2. Equipment required for a Calibration System

The equipment required to achieve thermal calibration of temperature probes is dependent on the desired accuracy and also ease of use. The greater the required accuracy, the more demanding the procedure becomes and of course, the greater the cost.

The required equipment generally falls into one of three groups

1. General purpose system for testing industrial plant temperature sensors will usually provide accuracies between 1.0°C and 0.1°C using comparison techniques.
2. A secondary standards system for high quality comparison and fixed point measurements will provide accuracies generally between 0.1°C and 0.01°C.
3. A primary standards system uses the most advanced and precise equipment to provide accuracies greater than 0.001°C.

Typical equipment used for comparison calibration is a standard or secondary PRT, several temperature baths, and a data acquisition system.

a.) Temperature sensor

For lower temperature calibration Platinum resistance detector is used in the form of SPRT and RTD, these are very stable and accurate. For higher temperature calibration, Noble metal thermocouple is used like R, S type thermocouple. These sensors must have accuracy and repeatability. The detail of these temperature sensors is described in previous chapters and SPRT & SSPRT is discussed below:

Standard PRT's

A standard platinum resistance thermometer (SPRT) is the most accurate standard available, however, it is the most expensive standard, and other standards are acceptable alternatives depending upon the temperature range covered, the accuracy desired, the capabilities, or the preference of the calibration laboratory.

SPRT is a specially constructed assembly using a close tolerance Pt100 sensing resistor or a specially wound platinum element with a choice of R_0 values. Construction is such as to eliminate the possibility of element contamination and various techniques are utilised to end this, such as special sheath materials, gas filling and special coil suspension.

Standard PRT's is Very fragile. This is mainly use in laboratory environments. Highest accuracy, high repeatability, low drift -200 to 661°C, accurate to $\pm 0.001^\circ\text{C}$.

Secondary SPRT

The secondary standard PRT's is much more user friendly and can survive mild handling mishaps. It is less expensive than an SPRT. Metal Sheathed Semi Standard Platinum Resistance Thermometer are widely used as references to calibrate various temperature probes, particularly in secondary calibration laboratories.

The structure of the thermometer is similar to that of SPRTs. The differences include the applications of certain techniques to protect the element from contamination at high temperatures and mechanical shocks.

Basic Construction of SSPRT

SSPRT is constructed with a 6 mm outer diameter Inconel Sheath for high durability. Inside the sheath, the sensing element is protected by a thin platinum housing that shields the sensor from contamination from free floating metal ions found within metal environment at high temperatures. A special powder mixture is filled into the sensor capsule to support the element wire to protect the element from mechanical shocks. After all element parts and powder are assembled into the sensor protection capsule, a pure mixture of gases, including oxygen, is filled into the sensor at high temperature. The sensor is hermetically sealed under pressure. The unit is hermetically sealed using a glass to metal seal.

Improving Stabilities of SSPRT

There is a trade-off between the oxidation effect and element contamination in metal sheathed semi standard platinum resistance thermometer. Excessively high O₂ leads to sensor contamination. The oxygen content in a thermometer may become unknown after a period of operation due to slow oxidation of the metal sheath and consequent loss of oxygen in metal sheathed SSPRT.

A feasible solution to protect against contamination is to seal the element separately from its sheath. This solution can resolve the conflict between the oxidation effect and element contamination and improve the long term stability of Metal Sheathed SSPRTs.

Master thermocouple

Industrial thermometers come in a variety of forms and types, calibrating them can be quite complicated.

To calibrate industrial sensors the laboratory must compare them to standard thermometers whose characteristics have been defined and are traceable to National Standards. Such thermometers that are traceable to national standard are known as 'Master thermocouple'.

Master thermocouple is used as a reference sensor in comparison type calibration process.

Master thermocouple is put in the highly stable temperature zone along with sensor under calibration, their reading is compared and error is calculated.

Master thermocouple should have high accuracy, and repeatability and should be recalibrated after certain period of time (generally time period suggested by calibration Laboratories).

b.) Temperature readout method

These instruments measure the output of the sensors, they must have high resolution and good accuracy.

c.) Secondary Temperature source

Dry block calibrators

Dry block calibrators provide the most convenient, portable facilities for checking industrial probes and they usually achieve reasonably rapid heating and cooling. The units consist of a specially designed heated block within which is located an insert having wells for the probes. The block temperature is controlled electronically to the desired temperature. The whole assembly is housed in a freestanding case. Although the block temperature is accurately controlled, any indication provided should be used for guidance only. As with any comparison technique, a certified sensor and indicator should be used to measure the block temperature and used as a reference for the test probe.

Black Body furnace is also a dry bath, but used in non contact calibration. The black body furnace has been designed to provide stable and accurate temperature to provide stable and accurate temperature to enable professionals to calibrate non contact radiation pyrometer by comparison method.

Stirred liquid baths

Stirred liquid baths provide superior thermal environments for probe immersion since no air gaps exist between the probe and medium. Thermal coupling is therefore much better than the alternatives described, and stirring results in very even heat distribution throughout the liquid.

With the help of this bath, the comparison calibration accuracy can be considerably greater than that which can be achieved in any metal block bath. It also has a larger calibration area, that allows more probes to be calibrated and a greater immersion depth which provide a superior thermal environment for probe immersion since air gaps exists between the probe and the medium. Thermal coupling is therefore much better than the alternatives described and as a result of stirring heat distribution is very even throughout the liquid.

Water from 0 to +80°C and oils for up to 300°C, Various molten salts and sand baths are used for temperatures in excess of 300°C.

Ice bath and negative bath

Ice Bath

The ice bath is made up of a mixture of melting shaved ice and water. The ice bath is a convenient and inexpensive way to achieve an ice point; it can be reproduced with ease and with exceptional accuracy. Junctions formed between the thermocouple materials and instrument leads can be simply immersed into the slush mixture, or alternatively glass "U" tubes containing a quantity of mercury approximately 3/4" to 1" depth can be placed into the slush mixture. Quick electrical connection can then be made between thermocouple and instrument leads through the mercury.

Negative temperature bath and Ice bath is mainly used for RTD calibration which provides negative temperature for low temperature calibration application. In this device a compressor and CFC gas is used for cooling purpose. Methanol is used as a medium for temperature below 0°C.

Fluidized calibration baths

The fluidized calibration bath is a unique method of providing closely controlled temperatures. The bath consists of a very fine mesh aluminum oxide, a heated chamber into which the medium is placed, and a means for slowly agitating the bath by introducing a flow of air. By careful control of heat input and air flow, temperatures of the bath can be controlled within close limits thereby producing isothermal conditions between the calibration standard and the test setup. Fluidized beds are useful for calibrating over the temperature range from ambient to 700°C.

4.3 Uncertainty Factor

In earlier days, in general, the error or inaccuracy of a test instrument was a matter of concern when using the test instruments as reference. The concept of uncertainty is very frequently used in the calibration of precision equipments, where high degree of accuracy is required for measurement. This concept is considered for various important parameters.

Nowadays, calibration Labs are required to calculate and affix a total or expanded uncertainty for all measurements during calibration of a test instrument. It must be noted that 'error' is not 'uncertainty'.

UUC Description :

One sample describes as PTRH13%-PT "R" TYPE THERMOCOUPLE Sr. No. TTCR-13 ; was received.

Calibration Required at °C : 250, 500, 750, 1000, 1200, 1500

Calibration Procedure : The UUC was allowed to equilibrate within controlled stable thermal environment, along with a standard sensor. The reading of sensor were recorded at specified temperature point. As per work instruction no. WI-LAB-17. The report provide the reading and deviation at the specified Point
Temperature (in °C) against thermocouple reading (in μV) are calculated by using ASTM E-230/IS table.

The Thermocouple has been compared with the following working standard of sensor & measuring instrument.

Standards	Traceable To	Certificate No.	Valid Upto
MASTER "RTD" - Pt100	INT. STD. (DKD)	3013	30-05-12
THERMOCOUPLE "S" TYPE		13153	28-01-12

**CALsys
-80/50**

-80 to 50°C

HIGH STABILITY BATH

CALsys -80/50 is a Highly Stable Stirred Liquid Bath for Calibration RTD / Thermocouple and also for compensation of cold junction.

CALsys -80/50 offers the temperature range of -80 to 50°C. It has large tank which is filled with liquid Methanol. The liquid is heated or cooled to the desired temperature.

It has better stability & uniformity than dry block bath and as it uses of stirred liquid.

This CALsys -80/50 is built using CFC free refrigerants.

KEY FEATURES

- ✓ Large Immersion Depths
- ✓ High Accuracy
- ✓ High Stability and Uniformity
- ✓ Wide Temperature Range
- ✓ PC Interface
- ✓ Simple to use and Cost effective

STANDARD ACCESSORIES

- Reference Standard PRT...Part No. TPRT-A-300
- **NABL** accredited calibration certificate - 3 point
- **Software** - Cal Soft including for setting bath temperature and monitoring the PV. Graphical representations of PV/TIME with 2 hours data logging.
- Operational Manual

OPTIONAL ACCESSORIES

Methanol 10 Ltr. No.(3050-M)

SPECIFICATIONS

Temp. Range : -80 to 50°C

Stability : $\pm 0.04^{\circ}\text{C}$ at -80°C (Methanol)
 $\pm 0.07^{\circ}\text{C}$ at 0°C (Methanol)
 $\pm 0.05^{\circ}\text{C}$ at 50°C (Water)

Uniformity : $\pm 0.05^{\circ}\text{C}$ at -80°C
 $\pm 0.09^{\circ}\text{C}$ at 0°C
 $\pm 0.07^{\circ}\text{C}$ at 50°C

Temperature Resolution : 0.1°C

Time to Reach Min. Temp. : 2 Hrs

Medium : Methanol

Controlling Sensor : PT-100

Volume : 9 Ltr.

Access Opening : 100 x 130 mm

Depth : 200 mm

Method of control : Digital self tuned PID Controller

Computer Interface : RS - 232

Operating Temperature : 20 to 25°C

Power Requirement : 230 VAC, 2.0 KW

Dimensions : 750 x 850 x 650 mm

Weight : 80 Kgs.

(Large depth available on custom built model)

**CALsys
-35/200**

-35 to 200°C

HIGH STABILITY BATH

CALsys -35/200 is a Highly Stable Stirred Liquid Bath for calibrating RTD / Thermocouple and also for compensation of cold junction.

CALSys -35/200 offers the temperature range of - 35 to 200°C. It has large well which is filled with liquid (Water+Methanol /Silicon Oil). The liquid is heated or cooled to the desired temperature. Methanol+Water is used for Negative Temperature and Silicon Oil for Heating.

It has better stability & uniformity than dry block bath and as it uses of stirred liquid.

This CALsys -35/200 is built using CFC free refrigerants.

KEY FEATURES

- ✓ High Accuracy
- ✓ High Stability and Uniformity
- ✓ Wide Temperature Range
- ✓ PC interfacing
- ✓ Simple to use and cost effective
- ✓ LCD screen controller
- ✓ Level Alarm

STANDARD ACCESSORIES

- Reference Standard PRT...Part No.TPRT-A-300

 $\pm 0.05^{\circ}\text{C}$ at 0°C (Methanol)
 $\pm 0.04^{\circ}\text{C}$ at 200°C (Silicon Oil)

Uniformity : $\pm 0.03^{\circ}\text{C}$ at -35°C
 $\pm 0.07^{\circ}\text{C}$ at 0°C
 $\pm 0.07^{\circ}\text{C}$ at 200°C

Temperature Resolution : 0.01°C

Time to Reach Max Temp : 1.5 Hrs

Medium Cooling : Methanol + Water

Medium Heating : Silicon Oil

Controlling Sensor : PT-100

Volume : 7 Ltr.

Access Opening : 157(L) x 142(W)

Depth : 127 mm

Method of Control : Digital self tuned PID Controller

Computer Interface : RS - 232

Operating Temperature : 20 to 25°C

Wetted Part : SS-304

Power Requirement : 230 VAC, 2.0 KW

Dimensions : 540(L) x 220(W) x 620(H)mm

Weight : Approx 41 Kg

CALsys
-15/110

-15 to 110°C

PELTIER BASED TEMPERATURE CALIBRATOR

CALsys -15 / 110 offers medium temperature range from -15 to 110°C. It is a highly stable standard temperature source for calibrating RTD / thermocouples. It has peltier elements to generate stable temperature in the well.

The comparison volume is a metallic block of aluminum, which has diameter of 24mm and 120mm length.

The temperature of the calibrator is set and controlled by a self tuned PID controller with automatic super fine adjustment.

KEY FEATURES

- ✓ Wide Operating Range (-15 to 110°C)
- ✓ High Stability
- ✓ PC interfacing
- ✓ Simple to use and cost effective
- ✓ Portability

STANDARD ACCESSORIES

- Reference Standard PRT.....Part No. TPRT -A-300
- **NABL** accredited calibration certificate - 3 point
- **Software** - Cal Soft including for setting bath temperature and monitoring the PV. Graphical representations of PV/TIME with 2 hours data logging.
- Operational Manual
- Carry Case

OPTIONAL ACCESSORIES

Extra Equalizing Block

SPECIFICATIONS

Temperature Range : -15 to 110°C

Temperature Resolution : 0.1°C

Stability : ±0.03°C at -15°C
 ±0.05°C at 0°C
 ±0.07°C at 110°C

Uniformity : ±0.05°C at -15°C
 ±0.07°C at 0°C
 ±0.09°C at 110°C

Controlling Sensor : Precision PRT

Method of Control : Digital self tuned PID Controller

Removable Insert Construction : Dia 24 x 120 mm long, 3 x 6 mm hole with 115mm insertion depth

Time to Reach Max/Min Temp : 25 Mins

Operating Temperature : 20 to 25°C

Computer Interface : RS - 232

Power Requirement : 230 VAC, 500 W

Dimensions : 380(H) x 170(W) x 188(D) mm

Weight : Approx 14 Kg

**CALsys
250**

50 to 250°C

HIGH ACCURACY LIQUID CALIBRATION BATH

CALsys 250 calibration bath is a highly stable standard stirred liquid bath for calibrating RTDs / Thermocouples and other temperature sensors in the laboratory. The temperature of the bath is set and controlled by a self tuned PID controller with automatic super fine adjustment.

The unique features is portability with very high stability and uniformity. The medium used in the bath is silicon oil.

KEY FEATURES

- ✓ Large Immersion Depths
- ✓ Wide Operating Range (50 to 250°C)
- ✓ High Stability and Uniformity
- ✓ PC interfacing
- ✓ Simple to use and cost effective
- ✓ Portability

STANDARD ACCESSORIES

- Silicon Oil..... Part No.C300S-LB-SO
- Reference Standard PRT Part No.TPRT-A-300
- **NABL** accredited calibration certificate - 3 point
- **Software** - Cal Soft including for setting bath temperature and monitoring the PV. Graphical representations of PV/TIME with 2 hours data logging.
- Operational Manual
- Carry Case

OPTIONAL ACCESSORIES

Silicon Oil.....Part No C200S-LB-SO

SPECIFICATIONS

Temperature Range : 50 to 250°C

Temperature Resolution : 0.1°C

Stability : ±0.015°C at 50°C
 ±0.025°C at 150°C
 ±0.05°C at 250°C

Uniformity : ±0.02°C at 50°C
 ±0.04°C at 150°C
 ±0.08°C at 250°C

Controlling Sensor : Precision PRT (PT-100)

Method of Control : Digital self tuned PID Controller

Medium of Heating : Silicon Oil

Time to Reach Max Temp : 30 Mins

Computer Interface : RS - 232

Operating Temperature : 20 to 45°C

Power Requirement : 230 VAC, 1.0 KW

Dimensions : 360(H) x 185(W) x 285(D) mm

Access Opening : 90 mm Dia

Depth : 140 mm

Removable Insert Construction : 6 holes of 15 mm Dia

Weight : Approx 12 Kg

Volume : 900 ml

Wetted Parts : Aluminium

(Large depth available on custom built model)

CALsys 650

50 to 650°C

PORTABLE CALIBRATOR

CALsys 650 offers medium temperature range from 50 to 650°C. It is a highly stable standard furnace for calibrating thermocouples / RTD . It has been designed for medium range temperature calibration and find application in the glass, electrical power, automotive & material processing industries.

The comparison volume is a metallic block of special material, which has diameter of 32mm and 150mm long

The temperature of the calibrator is set and controlled by a self tuned PID controller with automatic super fine adjustment.

KEY FEATURES

- ✓ Large Immersion Depths
- ✓ Wide Operating Range (50 to 650°C)
- ✓ High Stability
- ✓ PC interfacing
- ✓ Simple to use and cost effective

STANDARD ACCESSORIES

- Reference Standard Thermocouple ('K' Type T/C)..... Part No. TTCK-300
- NABL accredited calibration certificate - 3 point
- **Software** - Cal Soft including for setting bath temperature and monitoring the PV. Graphical representations of PV/TIME with 2 hours data logging.
- Operational Manual
- Carry Case

OPTIONAL ACCESSORIES

Customized Equalizing Block.....Part No. EQ1

SPECIFICATIONS

Temperature Range : 50 to 650°C

Temperature Resolution : 0.1°C

Stability : ±0.025°C at 50°C
±0.035°C at 350°C
±0.07°C at 650°C

Uniformity : ±0.04°C at 50°C
±0.07°C at 350°C
±0.09°C at 650°C

Controlling Sensor : T/C "N" TYPE

Method of Control : Digital self tuned PID Controller

Insert Construction : Dia 32 x 150 mm long with 4 holes of 6.5 x 120 mm insertion depth

Time to Reach Max Temp : 25 Mins

Time to Reach Max Temp to 100°C : 70 Mins

Computer Interface : RS - 232

Operating Temperature : 20 to 45°C

Power Requirement : 230 VAC, 1 KW

Dimensions : 325(H) x 185(W) x 265(D) mm

Weight : Approx 10 Kg

Carrying Case

Interchangeable Inserts
(as per requirement)

CALsys 1200

250 to 1200°C

PORTABLE THERMOCOUPLE CALIBRATOR

CALsys 1200 offers high temperature range from 250 to 1200°C. It is a highly stable standard furnace for calibrating Thermocouples / RTD. It has been designed for high temperature range calibration and find application in the glass, electrical power, automotive & material processing industries.

The comparison volume is a metallic block of special material, which is 37 mm in diameter with 215 mm long.

The temperature of the calibrator is set and controlled by a self tuned PID controller with automatic super fine adjustment.

Version with 3 zone furnace is also available.

KEY FEATURES

- ✓ Large Immersion Depths
- ✓ Wide Operating Range (250 to 1200°C)
- ✓ High Stability
- ✓ PC interfacing
- ✓ Simple to use and cost effective

STANDARD ACCESSORIES

- Reference Standard Thermocouple ('N' Type T/C) Part No. TTCN-300
- NABL accredited calibration certificate - 3 point
- **Software** - Cal Soft including for setting bath temperature and monitoring the PV. Graphical representations of PV/TIME with 2 hours data logging.
- Operational Manual
- Carry Case

OPTIONAL ACCESSORIES

Customized Equalizing Block....Part No. EQ2

SPECIFICATIONS

Temperature Range : 250 to 1200°C

Temperature Resolution : 1.0°C

Stability : ±0.1°C at 250°C
±0.2°C at 700°C
±0.4°C at 1200°C

Uniformity : ±0.20°C at 250°C
±0.24°C at 700°C
±0.26°C at 1200°C

Controlling Sensor : PT/RH-PTT/C

Method of Control : Digital self tuned PID Controller

Insert Construction : Dia 37 x 215 mm long (2X6mm & 2X8 mm holes) of 160mm insertion depth

Time to Reach Max Temp : 1.5 Hrs

Cooling Time 1200°C to 250°C : 180 Mins

Computer Interface : RS - 232

Operating Temperature : 20 to 45°C

Power Requirement : 230 VAC, 1.5 KW

Dimensions : 405(H) x 205(W) x 285(D) mm

Weight : Approx 14 Kg

Carrying Case

Interchangeable Inserts
(as per requirement)

**CALsys
1200L**

300 to 1200°C

HIGH STABILITY BLOCK FURNACE

CALsys 1200L calibration source is a highly stable standard furnace for calibrating thermocouples in the laboratory. The temperature of the furnace is set and controlled by a self tuned PID controller with automatic super fine adjustment.

The standard insert is a metallic block of special material, which is 37mm in diameter with 240 mm long and can hold up to four thermocouples.

It has been designed for high temperature range calibration and find application in the glass, electrical power, automotive, material processing industries & laboratories.

Special Version with 3 zone furnaces are available.

KEY FEATURES

- ✓ Large Immersion Depths
- ✓ Wide Operating Range (300 to 1200°C)
- ✓ High Stability
- ✓ PC interfacing
- ✓ Simple to use and cost effective

STANDARD ACCESSORIES

- Reference Standard Thermocouple ('N' Type T/C) Part No. TTCN-300
- **NABL** accredited calibration certificate - 3 point
- **Software** - Cal Soft including for setting bath temperature and monitoring the PV. Graphical representations of PV/TIME with 2 hours data logging.
- Operational Manual

OPTIONAL ACCESSORIES

Extra Equalizing Block.....Part No. EQ2

SPECIFICATIONS

Temperature Range : 300 to 1200°C

Temperature Resolution : 1.0°C

Stability : $\pm 0.1^\circ\text{C}$ at 300°C
 $\pm 0.2^\circ\text{C}$ at 700°C
 $\pm 0.35^\circ\text{C}$ at 1200°C

Uniformity : $\pm 0.15^\circ\text{C}$ at 300°C
 $\pm 0.25^\circ\text{C}$ at 700°C
 $\pm 0.4^\circ\text{C}$ at 1200°C

Controlling Sensor : Precision PT/RH-PT T/C

Method of Control : Digital self tuned PID Controller

Insert Construction : Dia 37 x 240 mm long
(2X6mm & 2X8 mm holes) of 160mm insertion depth

Time to Reach Max Temp : 1.5 Hrs

Computer Interface : RS - 232

Operating Temperature : 20 to 45°C

Power Requirement : 230 VAC, 2.0 KW

Dimensions : 500(H) x 400(W) x 490(D) mm

Weight : Approx 50 Kg

Optional Block

CALsys 1500L

500 to 1500°C

HIGH STABILITY BLOCK FURNACE

CALsys 1500L calibration source is a highly stable standard furnace for calibrating thermocouples in the laboratory. The temperature of the furnace is set and controlled by a self tuned PID controller with automatic super fine adjustment.

The standard insert is a Ceramic Tube, which is 37 mm in diameter with 245 mm long and can hold up to four thermocouples.

It has been designed for high temperature range calibration and find application in the glass, electrical power, automotive & material processing industries and laboratories.

KEY FEATURES

- ✓ Use of Silicon Carbide Spiral Rod Heaters
- ✓ Large Immersion Depths
- ✓ Wide Operating Range (500 to 1500°C)
- ✓ High Stability
- ✓ PC interfacing
- ✓ Simple to use and cost effective

STANDARD ACCESSORIES

- **NABL** accredited calibration certificate - 3 point
- **Software** - Cal Soft including for setting bath temperature and monitoring the PV. Graphical representations of PV/TIME with 2 hours data logging.
- Operational Manual

OPTIONAL ACCESSORIES

Reference Standard Thermocouple (PT-RH/PT 'R' Type T/C) Part No. TTCR-300

Extra Equalizing Block.....Part No. Eq2

SPECIFICATIONS

Temperature Range : 500 to 1500°C

Temperature Resolution : 1.0°C

Stability : ±0.4°C at 500°C
 ±0.7°C at 1000°C
 ±1.0°C at 1500°C

Uniformity : ±0.6°C at 500°C
 ±0.8°C at 1000°C
 ±0.9°C at 1500°C

Controlling Sensor : PT-RH/PTT/C

Method of Control : Digital self tuned PID Controller

Insert Construction : Dia 37 x 245 mm long
(2X6mm & 2X8 mm holes) of 140mm insertion depth

Heaters : Silicon Carbide Spiral Rod Heater

Time to Reach Max Temp : 2 Hrs

Computer Interface : RS - 232

Operating Temperature : 20 to 45°C

Power Requirement : 230 VAC, 3.0 KW

Dimensions : 570(H) x 450(W) x 520(D) mm

Weight : 55 Kg

**CALsys
1700L**

500 to 1700°C

HIGH TEMPERATURE BLOCK FURNACE

CALsys 1700L calibration source is a highly stable standard furnace for calibrating thermocouples in the laboratory. The temperature of the furnace is set and controlled by a self tuned advanced PID controller with automatic super fine adjustment.

The standard insert is a Ceramic Tube, which is 37 mm in diameter and 240 mm long and can hold up to four thermocouples.

It has been designed for high temperature range calibration and find application in the glass, electrical power, automotive & material processing industries and laboratories.

KEY FEATURES

- ✓ Use of Molybdenum Disilicate Heaters (MoSiO₂)
- ✓ Large Immersion Depths
- ✓ Wide Operating Range (500 to 1700°C)
- ✓ High Stability
- ✓ PC interfacing
- ✓ Simple to use and cost effective

STANDARD ACCESSORIES

- **NABL** accredited calibration certificate - 3 point
- **Software** - Cal Soft including for setting bath temperature and monitoring the PV. Graphical representations of PV/TIME with 2 hours data logging.
- Operational Manual

OPTIONAL ACCESSORIES

Reference Standard Thermocouple (PT-RH/PT 'B' Type T/C) Part No. TTCB-300

Extra Equalizing Block.....

Black Body Cavity.....Part No. Eq3

SPECIFICATIONS

Temperature Range : 500 to 1700°C

Temperature Resolution : 0.1°C

Stability : ±0.5°C at 500°C
 ±1.0°C at 1200°C
 ±1.5°C at 1700°C

Uniformity : ±0.7°C at 500°C
 ±1.4°C at 1200°C
 ±1.9°C at 1700°C

Controlling Sensor : Precision PT/RH-PT T/C

Heaters : MoSiO₂

Method of Control : Digital self tuned PID Controller

Insert Construction : Dia 37 x 240 mm long
(2x6mm & 2x8 mm holes) of 225mm insertion depth

Time to Reach Max Temp : 3 Hrs

Computer Interface : RS - 232

Operating Temperature : 20 to 45°C

Power Requirement : 230 VAC, 3 KW

Dimensions : 640(H) x 500(W) x 550(D) mm

Weight : 80 Kg

CALsys 500BB 50 to 500°C

PORTABLE BLACK BODY

CALsys 500BB calibration source is a highly stable standard Portable Black Body Furnace for calibrating non contact IR thermometer for the wide temperature range of 50 to 500°C.

The unique feature of this Portable Black Body Furnace is large temperature controlled black body target with a diameter of 100 mm which offer large view area for IR Thermometer

The Emissivity of the target is 0.95(±0.01). The temperature of the Calibrator is set and controlled by a self tuned PID controller with automatic super fine adjustment.

KEY FEATURES

- ✓ Large Aperture Area
- ✓ Wide Operating Range (50 to 500°C)
- ✓ High Stability
- ✓ PC interfacing
- ✓ Simple to use and cost effective
- ✓ Portability

STANDARD ACCESSORIES

- **NABL** accredited calibration certificate - 3 point
- **Software** - Cal Soft including for setting bath temperature and monitoring the PV. Graphical representations of PV/TIME with 2 hours data logging.
- Operational Manual
- Carry Case

OPTIONAL ACCESSORIES

Master Pyrometer

SPECIFICATIONS

Temperature Range : 50 to 500°C

Temperature Resolution : 0.1°C

Stability : ± 0.5°C at 50°C
± 0.8°C at 250°C
± 1.0°C at 500°C

Controlling Sensor : T/C "N" type

Method of Control : Digital self tuned PID Controller

Emissivity : 0.95 ± 0.01

Time to Reach Max Temp : 45 Mins

Computer Interface : RS - 232

Operating Temperature : 20 to 45°C

Power Requirement : 230 VAC, 1.0 KW

Dimensions : 320(H) X 355(W) X 255(D) mm

Target Size : Dia - 100 mm (Ridged Aluminum Plate)

Weight : Approx 10 Kg

**CALsys
1200BB**

300 to 1200°C

HIGH STABILITY BLACK BODY FURNACE

CALsys 1200BB calibration source is a highly stable standard Black Body Furnace for calibrating non contact IR thermometer for the wide temperature range of 300 to 1200°C.

The unique feature of this Black Body Furnace is large temperature controlled black body target with a diameter of 40 mm which offer large view area for IR Thermometer.

The Emissivity of the target is 0.99(±0.01). The temperature of the calibrator is set and controlled by a self tuned PID controller with automatic super fine adjustment.

KEY FEATURES

- ✓ Wide Operating Range (300 to 1200°C)
- ✓ High Stability
- ✓ PC interfacing
- ✓ Simple to use and cost effective

STANDARD ACCESSORIES

- **NABL** accredited calibration certificate - 3 point
- **Software** - Cal Soft including for setting bath temperature and monitoring the PV. Graphical representations of PV/TIME with 2 hours data logging.

Weight : 80 Kg

Fast Cal

Fast Cal 1200°C

Fast CAL is a time saving way to calibrate pyrometer with range upto 1200°C Now the pyrometer can be calibrated within few minutes using highly precise PID controller and a Controlling Pyrometer.

Fast Cal 2600°C

The Fast cal 2600 is an ultra high temperature black body calibrator and capability to produce very high temperature, high emissivity emitters and at the same time stabilize at the required temperature within minutes of switch on. All Safety features to protect equipment and operator are easily accessible.

The Target temperature is sensed by a rapid response infrared fiber optic pyrometer which drives a PID Controller to regulate the cavity temperature precisely to the desired set point.

SPECIFICATIONS

Temperature Range : 300 to 1200°C
Temperature Resolution : 0.1°C
Stability : $\pm 1^\circ\text{C}$
Emissivity : 0.95 (± 0.01)
Controlling Sensor : Pyrometer
Method of control : Digital self tuned advanced PID controller
Time to Reach Max Temp. : 30 sec. (max.)
Computer Interface : RS - 232
Operating Temperature : 20 to 45°C
Power required : 230 VAC, 3 KW
Dimension : 900(L)x 600(W)x 440(H) mm
Weight : 70 Kg

SPECIFICATIONS

Temperature Range : 700 to 2600°C
Temperature Resolution : 0.1°C
Stability : $\pm 3^\circ\text{C}$
Emissivity : 0.99 (± 0.01)
Controlling Sensor : Pyrometer
Method of Control : Digital self tuned advanced PID Controller
Time to Reach Max Temp. : 2 Mins
Computer Interface : RS - 232
Heater Size : 100 x 15 x 3 mm
Power Required : 440 VAC, 12KW
Dimension : 900(L) x 600(W) x 440(H) mm
Insert Gas : Argon Gas
Mounting Arrangement For Fast Cal : SS Trolley with in Built water tank. pump and other accessories
Weight : Approx 85 Kg

★ Optional available upto 3000°C also.

CalREF Reference Unit

CRCA BOX

FRP BOX

CalREF 0

- ✓ 0°C Thermoelectric reference unit
- ✓ Eliminates Old Fashioned "Ice Bath"
- ✓ Versatile use in industries, Laboratories, Instrument shop
- ✓ NABL Traceable Calibration Available

SPECIFICATIONS

Reference Junction Temperature : 0°C (Standard)
Types of T/C : J, K, T, E, N, R, S, B
Accuracy : $\pm 0.1^{\circ}\text{C}$, Errors can be compensated by adjusting controller setting
Stability : $\pm 0.03^{\circ}\text{C}$
Stabilization Time : 15 Mins
Capacity : 20 No (User Defined)
Resolution : $\pm 0.01^{\circ}\text{C}$
Dimension : 315(H)x305(W)x332(D) mm
Weight : 13Kgs
Power Supply : 230 VAC, 50 Hz
Carry case : Aluminium modular box

★ As per customer requirement from -15 to +90°C

CalREF 60

- ✓ 60°C Thermoelectric reference unit
- ✓ Versatile use in factory, Laboratory, Instrument Shop
- ✓ Rugged Outer case for safe Portability
- ✓ NABL Traceable Calibration Available

SPECIFICATIONS

Temperature Range : Ambient +10 to 90°C
Types of T/C : J, K, T, E, N, R, S, B
Accuracy : $\pm 0.5^{\circ}\text{C}$, Errors can be compensated by adjusting controller setting
Stability : $\pm 0.05^{\circ}\text{C}$
Stabilization Time : 10 Mins
Capacity : 6-24 Channel
(Max. Capacity : 48 Channel)
Resolution : $\pm 0.1^{\circ}\text{C}$
Dimension(CRCA) : 350(H) x 350(W) x 210(D) mm
Dimension(FRP) : 330(H)x330(W)x180(D) mm
Weight : 15Kg(CRCA), 10Kg(FRP)
Power Supply : 230 VAC, 50/60 Hz / 24 V DC

SSPRT

Metal Sheathed Semi Standard Platinum Resistance Thermometer are widely used as a reference to calibrate various temperature probes, particularly in secondary calibration laboratories.

SSPRT is constructed with a 6 mm outer diameter metal sheath of high durability. Inside the sheath, the sensing element is protected to shield the sensor from contamination by free floating metal ions found within metal environment at high temperatures.

The electrical configuration is a four wire current-potential hookup to eliminate effect of lead wire resistance.

A special powder mixture is filled into the sensor capsule to support the element wire to protect the element from mechanical shocks.

The element is housed in a special protective assembly to ensure minimum drift over long term use.

Fixed point calibration is provided as an option at TPW (0.01°C), Ga(29.7646°C), Sn(231.928°C), Zn(419.527°C), Al(660.323°C)

SPECIFICATIONS

Temperature Range : Upto 660°C

Outer Diameter : 6 mm

Outer Sheath : Inconel 600

Lead Wires : Platinum

RTPW : 100 Ω / 25 Ω

Long Term Drift : ± 50 mk/Yr.

Termination : M-F gold plated 4 Pin Lemo Connector/Flying Leads

Calibration Uncertainty : <4.0 mk at 0.01°C
 <8.5 mk at 29.7646°C
 <8.5 mk at 231.928°C
 <9.0 mk at 419.527°C
 <9.0 mk at 660.323°C

Calibration : NABL Accredited Calibration Certificate with ITS 90 Constants and Resistance Vs Temperature Chart in 1°C increment

KEY FEATURES

- ✓ High Accuracy & stability
- ✓ Manufactured & Tested under strict quality control standards
- ✓ Cycled to Stability
- ✓ Fast Response

RTD TPRT

TPRT-300 is highly accurate platinum resistance thermometer (pt100) offer the temperature range of -80 to 400°C.

TPRT-300 gives the benefit of high accuracy and low drift in a solid metal case. Wire wound resistance element give good stability with low temperature coefficient and high accuracy

TPRT-300 is constructed with a 6 mm outer diameter of SS-316 sheath of high durability .

TPRT is available in different accuracies and length.

KEY FEATURES

- ✓ High Accuracy & stability
- ✓ Manufactured & Tested under strict quality control standards
- ✓ Cycled to Stability
- ✓ Fast Response
- ✓ Low Drift

SENSOR	TYPE	RANGE (°C)	ACCURACY
RTD	PT 100	-80 to 400	Class A
		-80 to 250	1/3 DIN
		-80 to 250	1/5 DIN
		-80 to 250	1/10 DIN

Pt25, Pt200 on customer requirement.
 α temperature coefficient is 3850.
 3929 is on customer requirement.

ACCESSORIES

- ✓ NABL Accredited 3 point Calibration Certificate
- ✓ Digital Temp Indicator (Optional)

Selection : Part No.

Model No. : Accuracy - Length

Example. : TPRT : A - 300

SPECIFICATIONS

Type : PT-100 (Four Wire)

Temperature Range : -80 to 400°C

Element : PT-100

Accuracy : Class A, 1/3, 1/5, 1/10 Din

Sheath : 6 mm Dia, SS-316

Sheath Length : 300 mm, 450mm, 600mm

Cable Length : 1000 mm or as Required

End Connection : Flying Lead

MASTER THERMOCOUPLE TTC

These are Master Thermocouple Without Cold Junction. This range is based on popular Thermocouple Standards and available for different Temperature range, Sensitivity & length.

TTC are highly accurate and stable thermocouple with minimum uncertainties. It offer wide temperature range which is Ideal for all industrial applications. The size, length and thermocouple material are such that gives the best and most stable results. Options with built in cold junction compensation is also available.

KEY FEATURES

- ✓ High Accuracy & stability
- ✓ Cycled to Stability
- ✓ Fast Response
- ✓ Manufactured & Tested under strict quality control standards
- ✓ NABLA Accredited 3 point Calibration Certificate

Model No. Prefix	T/C Type	Material	Range (°C)	Accuracy	Sensitivity ($\mu\text{V}/^\circ\text{C}$)	Options in Sheath length(mm)	Options in Cable length(mm)	Outer Sheath
TTCN/TTCK	N/K	NiCrSi-NiSi/ NiCr-NiAl	Upto 1200	$\pm 1.1^\circ\text{C}$ or $\pm 0.4\%$	39 - 41	300, 450 & 600	1000 & 1500	INCONEL
TTCR/TTCS	R/S	Pt-13RhPt/ Pt-10RhPt	Upto 1500	$\pm 0.6^\circ\text{C}$ or $\pm 0.1\%$	6 - 12	300, 450 & 600	1000 & 1500	CERAMIC

Selection : Part No.

Model No. type - Length

Ex. : TTCN-300

COLD JUNCTION PROBE CTC

These Probes are used with various temperature sensor for cold junction compensation. The selection of probe depends on type of thermocouple .Double junctions are most commonly supplied (four wire connections per junction). Single junctions (two wire connections per junction) can also be supplied. Probes are available for different type of Thermocouples like J, K, N, R, S, T, E.

KEY FEATURES

- ✓ High Accuracy & stability
- ✓ Cost Effective solution
- ✓ Manufactured & Tested under strict quality control standards

This Probe is the best deal for all the calibration laboratory and test houses.

Model No. Prefix	Type Probe1, Probe2	Accuracy	Diameter (mm)	Options in sheath length(mm)	Options in Cable length(mm)	End Connection	Outer Sheath
CTC-N-N	N,N	$\pm 1.1^\circ\text{C}$ or $\pm 0.4\%$	6/8 mm	400 & 600	1000 & 1500	Flying Lead/M/F Connector	COPPER
CTC-K-K	K,K	$\pm 1.1^\circ\text{C}$ or $\pm 0.4\%$	6/8 mm	400 & 600	1000 & 1500	Flying Lead/M/F Connector	COPPER
CTC-R-R	R,R	$\pm 0.6^\circ\text{C}$ or $\pm 0.1\%$	6/8 mm	400 & 600	1000 & 1500	Flying Lead/M/F Connector	COPPER
CTC-S-S	S,S	$\pm 0.6^\circ\text{C}$ or $\pm 0.1\%$	6/8 mm	400 & 600	1000 & 1500	Flying Lead/M/F Connector	COPPER

Model No. Selection :
Cold Junction Probe-Probe1-Probe2-Length
Ex. : CTC-K-R-400

TEMPMET

Tempmet is a special high precision thermometer specially made for temperature calibration labs.

The unmatched resolution of 0.001°C and sturdy working makes it a laboratory workhouse.

SPECIFICATIONS

Model No. : C 3001

Accuracy of RTD Measurement : 0.01°C

Accuracy of T/C Measurement : 0.1°C

Resolution of RTD : 0.001°C

Resolution of T/C : 0.01°C

Measuring Input : 2 Channel

T/C Input : Type B, E, J, K, N, R, S, T

RTD Input : PT 100

Units : °C, °F, Ohm

Data Logging : 6850 values

Digital Communication : RS - 232

Battery : Rechargeable Type

TEMPMET 01 - RTD

RTD THERMOMETER

SPECIFICATIONS

RTD Range	: Pt 100 385 : -200°C ~ 800°C Pt 200 385 : -200°C ~ 600°C Pt 500 385 : -200°C ~ 600°C Pt 1000 385 : -200°C ~ 600°C Pt 100 3916 : -200°C ~ 600°C Pt 100 3926 : -200°C ~ 600°C

Temperature to EMF Tables and polynomial Coefficients of Thermocouples

The international standard IEC 584-1, in Europe EN 60 584-1, gives the relationship between the temperature t_{90} in °C and the thermal EMF E in μV for the mathematical calculation polynomial expression of higher degree are divides in several ranges, than the coefficients A has to be substituted by the C and D .

$$t_{90} = \sum_{i=0}^i A_i * E^i$$

For the thermocouple type K (NiCr-Ni), Following polynomial is used for the range from 0 to 1372°C:

$$E = B_0 + \sum B_i(t_{90})_i + C_0 \exp[C_i(t_{90} - 126,9686)^2]$$

for the daily use in calibration laboratories the inverse function is useful. The inverse function calculates the temperature t_{90} in °C from the Thermal EMF in μV . The inverse function is an approximation of higher degree and has the uncertainty given in the coefficient tables. The inverse function has the following common form:

$$E = \sum_{i=0}^i A_i (t_{90})^i$$

If the polynomial are divides in several ranges, Than the coefficient A has to be substituted by the coefficients C and D .

Important Notes :

For thermocouples type C (W5%Re-W26%Re) and D (W3%Re-W25%Re) the thermal EMF has the dimension mV (1 mV = 1000 μV)!

The inverse functions of types A, C and D have, to the date of this booklet, no official uncertainties for the approximations. It can be taken in account, the with quite high probability the uncertainty is significantly below 1 K.

In the appendix the polynomial coefficients for the non noble metal TC's are given first followed by the noble metal TC's. The polynomial coefficients for the refractory (high temperature) TC's are given at the end.

The following tables are calculated using the program MICROSOFT® EXCEL® in the version 2007 using the coefficients given herein. No reliability will be taken for mistakes in calculation. If in doubt, please use the official tables in the a.m. standard.

This booklet in no case substitutes the official printed version of the IEC 584-1 standard.

The polynomial coefficients for thermocouple type L (Fe-CuNi) are proposed by R.L.de Groot from Van Swinden Laboratory (VSL) at NMI in Delft/The Netherlands. They are commonly accepted for conversion temperature into EMF and vice versa.

The primarily German standard DIN 43 710 did not contain polynomial coefficients. The standard was withdrawn in October 1997.

GLOSSARY

1. Abbreviations and Acronyms for Standards & Standards bodies

ANSI	American National Standard Institute
ASTM	American Society for Testing and Material
BS	British Standard
DIN	Deutsche Industrial Norms
IEC	International Electrotechnical Commission
IPTS-68	International Practical Temperature Scale of 1968
ITS-90	International Temperature Scale 1990
IS	Indian Standard

2. Calibration

Calibration	Checking/Measuring Accuracy against an External Reference/Standard
Calibrator	Device used for or in calibration
Drift	Change in the value of a parameter due to operational influence (e.g. temperature variation/ageing)
Dry Block Calibrator	A thermal device which does not use a fluid medium as a temperature source
Fixed Points(Temperature)	Temperature defined by physical laws, Change of state of pure material
Fixed Point Cell	A device used to provide a fixed point temperature
Primary Standards	Those derived from the best available equipment. Pertaining to establishing the International Temperature Scale
Reference Probe	Certified Probe used as a comparison standard
Secondary Standard	Traceable to primary standard
Standard Resistance Thermometer	A laboratory standard probe for the highest possible accuracy of measurement
Stirred Liquid Bath	A controlled thermal reference which uses a stirred liquid medium
Temperature Calibration Point	A temperature value at which calibration is performed by comparison or direct techniques
Thermal Calibration	Calibration using a temperature source (I.e. not electrical)
Thermal Reference	Controller Temperature Source
Tolerance	Stated Uncertainties
Triple Point of Water	A thermodynamic state (of water) in which the gas, Liquid and solid phases all occur in equilibrium. Value 0.01°C
Uncertainties	Possible Inaccuracies

3. Control

Auto-manual	Selection of closed loop (Automatic) or open loop (manual) regulation
Auto-tune	Automatic selection of the control terms, usually P, I & D
Calibration	Checking/Measuring accuracy against an external reference or standard.
Closed Loop	Automatic control via feedback
Cold Junction	Built in, automatic cementation for ambient temperature
Compensation(Automatic)	Variations when using a thermocouple sensor
Control Output	The means of controlling energy regulation in the process
D	Abbreviation of Derivative
Dead-band	On-Off hysteresis to prevent excessively rapid power switching
Derivative Time Constant	A measure of derivative term sensitivity
Hysteresis	Dead-band defined in on-off switching
I	Abbreviation of Integral
Integral Time	Summation period for offset computation
Offset	Difference between set-point and resultant control point
On-Off	Power regulation by simple on-off switching (e.g. thermostat)
Open Loop	System not utilizing feedback (I.e. not capable of automatic control.)
Output	Control signal or communication data
Overshoot	The amount by which the process temperature exceeds set- point on start up
P	Abbreviation of proportional
Process	The system being monitored or controlled
Process Variable	The parameter monitored or controlled
Proportional Band	The control band within power is regulated between 0 and 100% usually expressed
Set-Point	Desired process temperature set by the operator
Start-Up	Dynamic state of the process after switching on
Thermal Mass	Heat storage effect in the process

4. Instrumentation General

Closed Loop	Facility for automatic control by means of temperature feedback from the process to the Instrument
-------------	--

Control	Regulation of process energy to achieve a desired temperature
Data Acquisition	Gathering data from a process, Usually electronic, Usually automatic
Indication	Analogue or digital readout of data
Input	The connector point for a sensor or defines type of sensor
Isolation	Electrically isolation condition
Linearisation	Matching the transfer characteristic of the sensor if non-linear (strictly de-linearisation)
Logging	Recording data
Non-linear	Not a straight line transfer characteristics
Open loop	System not utilizing feedback
Process	The system being monitored
Signal Conditioning	Changing the electrical characteristics of a sensor signal
Stability	The ability of an instrument to maintain a constant output with the application of a constant input
Temperature Coefficient Transmitter	An Amount by which a parameter varies due to temperature Instrumentation. Usually converts to 4-20mA.

5. Thermometry - General

Absolute zero	The lowest possible temperature of a body due to absence of molecular motion. Stated as 0 Kelvin, equivalent to -273.15°C
Alpha α	The temperature coefficient of resistance of a sensing resistor. Expressed as $\Omega/^{\circ}\text{C}$.
Alumina	Aluminium Oxide (a refractory material)
Base Metal Thermocouple	Thermocouple utilizing base metal
Boiling Point	The equilibrium temperature between a liquid and its vapour
Ceramic	Refractory insulating material
Coefficient (α, β, γ)	Used in the Pt100 Characteristics polynomial; they define the temperature resistance relationship.
Cold Junction	Reference junction of a thermocouple
Cold Junction	Compensation for thermocouple reference junction
Compensation (CJC)	Temperature Variations
Colour Codes	Means of cable and sensor type identification; applied internationally according to appropriate standard
Compensating Cable	Used for connecting thermocouple to instruments; the conductor use low cost materials which have a similar ambient thermal emf relationship to that of the thermo element but at lower cost
Compression Fitting	Type of threaded fitting which compresses on to the probe sheath to provided a pressure tight coupling
Cryogenic	A term for very low temperatures, usually associated with liquified gases (-180°C)
Drift	Change in the value of a parameter due to operational influence (e.g. temperature variation/againig)
EMF	Electromotive force (sometimes referred to as thermo-voltage).
Excitation Current	Current supplied to an appropriate sensor or transducer to provide excitations
Exposed junction	A thermo junction not protected by sheath material. Used when fast thermal response is required
Extension Cable	Thermocouple connecting cable which uses conductors in true thermocouple alloy
Fabricated	Made from component part e.g. thermocouple assembly made from tubing, wire and insulating material as opposed to one made using mineral insulated cable
Fitting	Items used to secure probes into machinery e.g. compression gland threaded bushes, bayonet fittings
Fixed Points (Temperature)	Temperature defined by physical laws, change of state of pure material
Flange	Form of disc through which probe is installed into a process
Freezing Point	The fixed temperature point of a material which occurs during the transition from a liquid to solid state. Also known as melting point for pure materials
Fundamental Intervals	Thermometer resistance change over the range to 0 to 100°C
Grounded Hot Junction	Thermocouple configuration in which the thermo element is electrically common to the sheath
Hot Junction	Measuring junction of thermocouple
Ice Point	0°C
Immersion	Placing of probe into the process medium (I.e. immersion into some medium)
Insert	Replaceable probe assembly located inside outer sheath
Insulation Resistance	Value of resistance measuring between the sensor wire and sheath
Interchangeability	Describes how closely a sensor adheres to its defining equation
Isothermal	Equal temperature
Lagging Extension	Probe or pocket extension to allow for thickness of pipe or wall lagging
Leg	Common term for one thermoelement wire in a thermocouple circuit
Linearity	A deviation in response from straight the value of sensor
Loop Resistance	the total resistance of thermocouple circuit
Measuring Junction	Thermoelement measuring junction (Hot junction)

Melting Point	The temperature at which a substance convert from the solid to liquid phase. This is same as the freezing point for pure material
Metallic	Pertaining to presence of metal in sheath material as opposed to non-metallic
MI	Abbreviation for mineral insulated as used in sensor cable
Mineral Insulated	Type of cable construction used in thermometry. Conductors are insulated from sheath by compressed refractory oxide powder
Nobel Metal	Rare metal, usually platinum/Rhodium alloys
Noise	Unwanted electrical interference picked up on a single cable
NTC	Negative temperature coefficient (of resistance)
Parallel pair	Wire construction where two single conductor are laid parallel
Platinum resistance Thermometer	Platinum temperature sensor whose resistance varies with temperature
Polarity	Determines the direction of current flow its operating environment
Protection Tube	A tube (Sheath) which protect a sensor from its operating environment
PTC	Positive temperature coefficient (of resistance)
Rare Metal Thermocouple	Thermocouple made of rare metal thermoelement
Reference Junction	Of the thermocouple, usually referred to the ice point
Resistance thermometer	Temperature sensor, usually platinum, whose resistance varies with temperature
Response Time	A measure of thermal sensitivity applied to sensors. The time required for a sensor to reach 63% of the step change temperature under particular conditions
R_0	The value of thermometer resistance temperature sensors at 0°C
RTD	Abbreviation for resistance temperature detector
Self-Heating	Heating effect due to current flow in the sensing resistance thermometer
Sensing Resistor	The sensing element of a resistance thermometer
Stability	The ability of a sensor to maintain a consistent output with the application of a constant input
Stem sensing	Sensing over a finite length as opposed to just the tip
Tails	Connecting wires emanating from the sensor
Thermal conductivity	The ability of a material to conduct heat
Thermal Gradient	The distribution of different temperature in and across an object
Thermal Mass	Heat storage effect in the process
Thermistor	A form resistance thermometer, usually a NTC type
Thermocouple type	Defines the of thermoelement e.g. J, K, T, N, R, S, B etc.
Thermoelectric	Electrical activity resulting from the generation of thermovoltage
Thermoelement	The two dissimilar conductor and their junction forming a thermocouple
Thermojunction	The junction formed between the dissimilar conductor of thermocouple. Usually describes the measuring junction.
Thermowell	Used to protect sensor probes against aggressive media. Effectively a pocket or well into which the probe is inserted
The Film	Sensing resistor in thin form (also flat film)
Tip Sensing	Temperature sensing at the tip of a probe only as opposed to along its length
Transducer	A device which converts energy from one form into another. Transducer often describes a sensor
Transfer Function	Input/Output characteristic of a device
Transmitter	A device for amplifying a sensor signal in order to permit its transmission to remote instrumentation. Usually converts to 4-20mA
Twisted Pair	Two insulated conductor twisted wires in thermocouple circuit minimise noise pick-up
Wheatstone bridge	Resistance bridge for precision measurement of Pt-100 sensing resistor
Wirewound	Sensing resistor in wirewound construction.

COLOUR CODE OF COMPENSATING CABLES & THERMOCOUPLES

THERMOCOUPLE CONDUCTOR COMBINATION TYPE	INTERNATIONAL COLOUR CODE TO IEC 5843:1989	AMERICAN TO ANSI/MC96.1 	JAPANESE TO JIS C 1610-1981 
K	 + -	 + -	 + -
T	 + -	 + -	 + -
J	 + -	 + -	 + -
N	 + -	 + -	
E	 + -	 + -	 + -
R	 + -	 + -	 + -
S	 + -	 + -	 + -
B	 + -	 + -	 + -
C	 + -
